**BEAGLEBOARD DESIGN**

These design materials referred to in this document are *NOT SUPPORTED* and DO NOT constitute a reference design. Only “community” support is allowed via resources at BeagleBoard.org/discuss.

There is no warranty for the design materials, to the extent permitted by applicable law. Except when otherwise stated in writing the copyright holders and/or other parties provide the design materials “as is” without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the quality and performance of the design materials is with you. Should the design materials prove defective, you assume the cost of all necessary servicing, repair or correction.

We mean it; these design materials may be totally unsuitable for any purposes.
BeagleBoard.org provides the enclosed product(s) under the following conditions:

This evaluation board/kit is intended for use for ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY and is not considered by BeagleBoard.org to be a finished end-product fit for general consumer use. Persons handling the product(s) must have electronics training and observe good engineering practice standards. As such, the goods being provided are not intended to be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety and environmental measures typically found in end products that incorporate such semiconductor components or circuit boards. This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and therefore may not meet the technical requirements of these directives or other related directives.

Should this evaluation board/kit not meet the specifications indicated in the User’s Guide, the board/kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies BeagleBoard.org from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user’s responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

BeagleBoard.org currently deals with a variety of customers for products, and therefore our arrangement with the user is not exclusive. BeagleBoard.org assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.

Please read the User’s Guide and, specifically, the Warnings and Restrictions notice in the User’s Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For additional information on BeagleBoard.org environmental and/or safety programs, please contact visit BeagleBoard.org.

No license is granted under any patent right or other intellectual property right of BeagleBoard.org covering or relating to any machine, process, or combination in which such BeagleBoard.org products or services might be or are used.

Mailing Address:

BeagleBoard.org

Richardson, TX 75081
WARRANTY: The BeagleBoard is warranted against defects in materials and workmanship for a period of 90 days from purchase. This warranty does not cover any problems occurring as a result of improper use, modifications, exposure to water, excessive voltages, abuse, or accidents. All boards will be returned via standard mail if an issue is found. If no issue is found or express return is needed, the customer will pay all shipping costs.

Before returning the board, please visit BeagleBoard.org/support

Please refer to sections 12 and 13 of this document for the board checkout procedures and troubleshooting guides.

To return a defective board, please request an RMA at http://beagleboard.org/support/rma.

1.0 Introduction

This document is the System Reference Manual for the BeagleBoard, a low cost OMAP3530 based board supported through BeagleBoard.org. Previously this document was known as the Hardware Reference Manual, but the name has been changed to more accurately reflect its contents which now include system setup, debugging, and software components. This document provides detailed information on the overall design and usage of the BeagleBoard from the System perspective.

The key sections in this document are:

Section 2.0– Change History
   Provides tracking for the changes made to the System Reference Manual.

Section 3.0– Definitions and References
   This section provides definitions for commonly used terms and acronyms.

Section 4.0– Overview
   This is a high level overview of the BeagleBoard.

Section 5.0– Specification
   Provided here are the features and electrical specifications of the BeagleBoard.

Section 6.0– Product Contents
   Describes what the BeagleBoard package looks like and what is included in the box.

Section 7.0– Hookup
   Covered here is how to connect the various cables to the BeagleBoard.

Section 8.0– System Architecture and Design
   This section provides information on the overall architecture and design of the BeagleBoard. This is a very detailed section that goes into the design of each circuit on the board.

Section 9.0– Connector Pinouts and Cables
   The section describes each connector and cable used in the system. This will allow the user to create cables or purchase cables or to perform debugging as needed.

Section 10.0– BeagleBoard Accessories
   Covered in this section are a few of the accessories that may be used with BeagleBoard. This is not an exhaustive list, but does provide an idea of the types of cables and accessories and how to find them. It also provides a definition of what they need to be. It does not guarantee that these devices will work on all OS implementations.

Section 11.0 – Mechanical
   Information is provided here on the dimensions of the BeagleBoard.

Section 12.0 – Board Verification
   A description is provided on how to setup the board and using the verification process and SW, verify that the board is functional.

Section 13.0 – Troubleshooting
Here is where you can find tips on troubleshooting the setup of the BeagleBoard.

Section 14.0- Known Issues
This section describes the known issues with the current revision of the BeagleBoard.

Section 15.0- BeagleBoard Components
These are the top and bottom side silkscreen of the BeagleBoard showing the location of the components.

Section 16.0- BeagleBoard Schematics
These are the schematics for the BeagleBoard itself.

Section 17.0- Bill Of Material
This section describes where to get the latest Bill of Material for the BeagleBoard.

Section 18.0- BeagleBoard PCB Information
This section describes where to get the PCB file information for the BeagleBoard.

2.2 Revision A vs. B4

The following bullets describe the differences between the Rev A and Rev B4 BeagleBoards.

- The DC power connector is now functional on the Rev B4 board.
The USB Host has been removed due to issues with the PCB layout. While working, the USB Host port was not reliable and caused the PHY to lockup under heavy loads.

EMU0 jumper was removed. This was required on the Rev A board when using the older version of the OMAP3530 processor. It is no longer needed on the version of silicon used on the Rev B board.

Added a capacitor to the VBUS signal. There were some cases reported that certain USB hubs would not connect due to noise on the VBUS rail.

The LEDS USR0 and USR1 can now be controlled separately. The previous version had the signals shorted together.

### 2.3 Revision B4 vs. B5

The following bullets describe the differences between the **Rev B4** and **Rev B5** BeagleBoards.

- Capacitor C70 was removed to improve the 32KHz clock rise and fall time. This fixes the GPT1 timer issue. This change can be easily made by the board owner using a soldering iron.

### 2.4 Revision B5 vs. B6

The following bullets describe the differences between the **Rev B5** and **Rev B6** BeagleBoards.

- The package used for U9 and U11 was changed in the PCB. This was to address the issue we had with failures due to issues with the package. No electrical changes were made.
- The Dx capacitor, which was hand mounted, was incorporated into the PCB layout. No electrical changes were made.
- The name of the TPS65950 was replaced with TPS65950 to reflect the catalog version of the device. The TPS65950 is still being used on the board.
- **Table 17** and **Table 21** were corrected to reflect the proper naming of the pins. No impact on the schematic.
- The OMAP3530 ES3.0 is being used on the B6 revision where B5 and earlier used the ES3.0.
2.5 Revision B6 vs. B7

The Revision B7 boards are built with OMAP3530 Rev ES3.0 silicon versus the ES2.1 on the Rev B6 board. There are no additional features on the BeagleBoard as a result of this change.
2.6 Revision B7 vs. C2

The Revision C2 is the first production release of the Rev C boards. Revisions C and C1 were never released to manufacturing. Following are the additions and changes on the Rev C2 board.

- Addition of (2) 20 pin connectors for access to the LCD signals.
- Addition of the USB Host connector on ULPI2.
- Addition of the mSecure control functions between the OMAP3530 and PMIC.
- Moved MMC1 WP to GPIO_23 (required when USB moved to ULPI2)
- Ability to read the board current by reading two ADC pins on the PMIC
- Addition of the board ID features such that the SW can determine if the board is a Rev B or Rev C.
- Addition of 128MB of DDR to bring the total to 256MB.
- Added a small shorting pad to allow the application of a blob of solder to ground the OTG pin 4. This allows for the use of a four pin USB cable when using the OTG port in the HOST mode.
- Swapped out three signals on the expansion connector to add access to three PWM signals. No features were lost on the expansion connector as a result.

This document only covers the Rev C2 & C3 boards. Throughout this document the differences between Rev C2 and Rev B boards are pointed out in their respective section. For information on the Rev B board, you will need to refer to the Rev B7 version of this document.

2.7 Revision C2 vs. C3

There are no major differences between the Rev C2 and Rev C3 Beagle Boards. Following are the additions and changes on the Rev C2 board.

- The four mounting holes are now plated through and connected to ground. This change was a request from the community. **There is no impact on SW due to this change.**
- Additional components were added to the S-Video interface to provide a slight improvement in the overall video quality. **There is no impact on SW due to this change.**
- A small Lithium battery was added to the PMIC to provide battery backup capabilities. This battery is optional and is not installed. This feature was a request from the community. **There is no impact on SW due to this change, however, this will result in SW being created to take advantage of this feature if the battery is installed.**
The TWL4030 PMIC was replaced with the TPS65950. This was the longstanding plan, but we were not able to do this due to supply issues with the TPS65950. Those issues have now been resolved. There is no impact on SW due to this change.

3.0 Definitions and References

3.1 Definitions

- **SD**- Secure Digital
- **SDIO**- Secure Digital Input Output
- **MMC**- Multimedia Card
- **MDDR**- Mobile Dual Data Rate
- **SDRAM**- Synchronous Dual Access Memory
- **OMAP3530**- The CortexA8 based System on a Chip from Texas Instruments.

4.0 BeagleBoard Overview

The BeagleBoard is an OMAP3530 platform designed specifically to address the Open Source Community. It has been equipped with a minimum set of features to allow the user to experience the power of the OMAP3530 and is not intended as a full development platform as many of the features and interfaces supplied by the OMAP3530 are not accessible from BeagleBoard. By utilizing standard interfaces, the BeagleBoard is highly extensible to add many features and interfaces.

4.1 BeagleBoard Usage Scenarios

The Figure 1 provides an example of a few of the various usage scenarios for the BeagleBoard.
Figure 1. BeagleBoard Usage Scenarios
5.0 BeagleBoard Specification

This section covers the specifications of the BeagleBoard and it also provides a high level description of the major components and interfaces that make up the BeagleBoard.

5.1 BeagleBoard Features

Table 2 provides a list of the BeagleBoard’s features. Features in **RED** are found on the Rev C2/C3 board only.

</tbody>
</table>
The following sections provide more detail on each feature and components on the BeagleBoard.

5.2 OMAP Processor

The BeagleBoard uses the OMAP3530 version ES3.0 and comes in a .4mm pitch POP package. POP (Package on Package) is a technique where the memory, NAND and SDRAM, are mounted on top of the OMAP3530. For this reason, when looking at the BeagleBoard, you will not find an actual part labeled OMAP3530.

5.3 Memory

The Micron POP memory is used on the Rev C2 BeagleBoard and is mounted on top of the processor as mentioned. The key function of the POP memory is to provide:

- 2Gb NAND x 16 (256MB)
- 2Gb MDDR SDRAM x32 (256MB @ 166MHz)

No other memory devices are on the BeagleBoard. It is possible however, that additional memory can be added to BeagleBoard by installing a NAND based device in the SD/MMC slot or use the USB OTG port and a powered USB hub to drive a USB Thumb drive or hard drive. Support for this is dependent upon driver support in the OS. On the Rev C2, the USB host port can be used in addition to the OTG port.

5.4 Power Management

The TPS65950 is used on the Rev C2 to provide power to the BeagleBoard with the exception of the 3.3V regulator which is used to provide power to the DVI-D encoder and RS232 driver. In addition to the power it also provides:

- Stereo Audio Out
- Stereo Audio in
- Power on reset
- USB OTG PHY
- Status LED

5.5 HS USB 2.0 OTG Port

The HS USB OTG port is the primary power source and communication link for the BeagleBoard and derives power from the PC over the USB cable. The client port is limited in most cases to 500mA by the PC. A single PC USB port is sufficient to power
the BeagleBoard. If additional devices are connected to the expansion bus and the 5V rail is used, then the power required could exceed that supplied by a USB port or Hub.

It is possible to take this to 1A by using a Y cable if additional power is needed for either the USB host port or an expansion card. **Figure 2** shows an example of the Y-Cable for the USB.

![Figure 2. USB Y-Cable](image)

The BeagleBoard requires a single minAB to USB A cable or as mentioned a Y-Cable can be used if needed. There is an option to provide external power to the BeagleBoard using a 5V DC supply and is discussed later in this section.

### 5.6 HS USB 2.0 Host Port (Rev C2 Only)

On the Rev C2 board a single USB HS only Host port is provided via a USB Type A connector. It provides power on/off control and up to 500mA of current at 5V.

The HS USB Port is HS only. In order to support a FS/LS device, a HUB must be used.

### 5.7 Stereo Audio Output Connector

A 3.5mm standard stereo output audio jack is provided to access the stereo output of the onboard audio CODEC. The Audio CODEC is provided by the TPS65950.

### 5.8 Stereo Audio In Connector

A 3.5mm standard stereo audio input jack is provided to access the stereo output of the onboard audio CODEC.
5.9  S-Video Connector

A 4 pin DIN connector is provided to access the S-Video output of the BeagleBoard. This is a separate output from the OMAP processor and can contain different video output data from what is found on the DVI-D output.

It will support NTSC or PAL format output to a standard TV. The default is NTSC, but can be changed via the Software.

5.10  DVI-D Connector

The BeagleBoard can drive a LCD panel equipped with a DVI-D digital input. This is the standard LCD panel interface of the OMAP3530 and will support 24b color output. DDC2B (Display Data Channel) or EDID (Enhanced Display ID) support over I2C is provided in order to allow for the identification of the LCD monitor type and settings.

The BeagleBoard is equipped with a DVI-D connector that uses an HDMI connector that was selected for its small size. It does not support the full HDMI interface and is used to provide the DVI-D interface portion only. The user must use a HDMI to DVI-D cable or adapter to connect to a LCD monitor. This cable or adapter is not provided with the BeagleBoard. A standard HDMI cable can be used when connecting to a monitor with an HDMI connector.

5.11  LCD Header (Rev C2 Only)

A pair of 1.27mm pitch 2x10 headers are provided to gain access to the LCD signals. This allows for the creation of LCD boards that will allow adapters to be made to provide the level translation to support different LCD panels.

5.12  SD/MMC 6 in 1 Connector

A 6 in 1 SD/MMC connector is provided as a means for expansion and can support such devices as:

- WiFi Cards
- Camera
- Bluetooth Cards
- GPS Modules
- SD Memory Cards
- MMC Memory Cards
- SDIO Cards
- MMCMobile cards
- RS-MMC Cards
- miniSD Cards
It supports the MMC4.0 (MMC+) standard and can boot from MMC or SD cards. It will support both 4 and 8 bit cards, but 8 Bit cards are 1.8V only and the boot mode supports a 3V card. **In order to boot from MMC/SD the card must be a 3V 4 bit card.**

One of the nice features is that the OMAP3530 can be booted from the SD/MMC. By holding the User button and forcing a reset, the BeagleBoard will boot from the SD/MMC.

### 5.13 Reset Button

When pressed and released, causes a full power on reset of the BeagleBoard. It should be noted that currently, the reset will not work when the Linux kernel is running. To reset the board from the kernel operation, a power cycle is required.

### 5.14 User/Boot Button

A button is provided on the BeagleBoard to provide two functions:

- Force a change in the boot sequence of the OMAP3530.
- Used as an application button that can be used by SW as needed.

When used in conjunction with the RESET button, it will force a change to the order in which boot sources are checked as viable boot sources.

If the button is pressed while the RESET button is released, the sequence becomes:

- USB
- UART
- MMC1
- NAND

Even though the NAND may have a program in it, if a card is placed in the MMC slot, it will try to boot from it first. If it is not there, it will boot from NAND.

There is also the option to have a serial download application that will program the NAND if connected to the serial or USB ports. In this scenario the internal ROM will stop on either the serial or USB port and start the download process from there. It does require an application to be run on the host PC in order to perform this function.

If the user button is not pressed at reset, the sequence in which the internal ROM looks for viable boot sources is as follows:

- NAND
- USB
- UART3
o MMC1

In this case, NAND overrides every option and will always boot from NAND if there is data in the NAND. If the NAND is empty, then the other sources are available to be used based on the boot order.

5.15 Indicators

There are three green LEDs on the BeagleBoard that can be controlled by the user.

- One on the TPS65950 that is programmed via the I2C interface
- Two on the OMAP3530 Processor controlled via GPIO pins

There is a fourth LED on the BeagleBoard that provides an indication that power is supplied to the board.

5.16 Power Connector

Power will be supplied via the USB OTG connector and if a need arises for additional power, such as when a board is added to the expansion connectors, a larger wall supply 5V can be plugged into the optional power jack. When the wall supply is plugged in, it will remove the power path from the USB connector and will be the power source for the whole board. The power supply is not provided with the BeagleBoard.

When using the USB OTG port in the host mode, the DC supply must be connected as the USB port will be used to provide limited power to the hub at a maximum of 100mA, so a hub must be powered. The 100mA is not impacted by having a higher amperage supply plugged into the DC power jack. The 100mA is a function of the OTG port itself.

**WARNING:** DO NOT PLUG IN ANYTHING BUT 5V TO THE DC CONNECTOR OR THE BOARD WILL BE DAMAGED!

Make sure the DC supply is regulated and a clean supply.

5.17 JTAG Connector

A 14 pin JTAG header is provided on the BeagleBoard to facilitate the SW development and debugging of the board by using various JTAG emulators. The interface is at 1.8V on all signals. Only 1.8V Levels are supported. DO NOT expose the JTAG header to 3.3V.
5.18 RS232 Header

Support for RS232 via UART3 is provided by a 10 pin header on the BeagleBoard for access to an onboard RS232 transceiver. It does require an IDC to DB9 flat cable, which is not provided, to access the serial port.

5.19 Expansion Header

An option for a single 28 pin header is provided on the board to allow for the connection of various expansion cards that could be developed by the users or other sources. Due to multiplexing, different signals can be provided on each pin providing more that 24 actual signal accesses. This header is not populated on the BeagleBoard so that based on the usage scenario it can be populated as needed (Top, Bottom, Top right angle, or Bottom Right angle).

5.20 BeagleBoard Mechanical Specifications

Size: 3.0” x 3.1”
Max height: TBM
Layers: 6
PCB thickness: .062”
RoHS Compliant: Yes
Weight: TBW
5.21 Electrical Specifications

Table 3 is the electrical specification of the external interfaces to the Rev C3 BeagleBoard. The items in RED are those that are different or have been added on the Rev C3 version. As the current footprint is different on the Rev C3 version, special attention should be paid to Table 4.

Table 3. BeagleBoard Electrical Specification Rev C3

6.0 Product Contents

Under this section is a description of what comes in the box when the BeagleBoard is purchased.

6.1 BeagleBoard In the Box Rev C2

The final packaged Rev C2 product will contain the following:

- 1 Box
- 1 BeagleBoard in an ESD Bag

**NO CABLES ARE PROVIDED WITH THE BEAGLEBOARD.**

![Figure 3. The Rev C2 Box](image)
6.2 Software on the BeagleBoard

The board ships with U-Boot and X-Loader flashed onto the BeagleBoard.

6.3 Repair

If you feel the board is in need of repair, follow the RMA Request process found at http://beagleboard.org/support/rma
7.0 BeagleBoard Hookup

This section provides an overview of all of the connectors on the BeagleBoard and how they should be used.

7.1 Connecting USB OTG

The USB OTG port connects to the PC host and uses a miniAB cable through which power is provided to the BeagleBoard. If desired, the BeagleBoard may also be connected to a self powered USB hub.

Figure 5 shows where the cable is connected to the BeagleBoard.

If the OTG Port is to be used as a Host, the ID pin must be grounded. This means that you must have a 5 pin cable connected to the OTG port on the BeagleBoard and you must use a USB powered HUB.
7.2 Connecting USB Host (Rev C2 Only)

The Rev C2 Beagle is equipped with a USB Host only connector and can be used to support USB based devices. In order to connect multiple devices a Hub is required. The hub can be powered or un-powered if the total current on the devices connected to the hub do not exceed the available power from the DC source. If the board is powered from the OTG connector, then the power available from this port is extremely limited and will not be able to provide sufficient power to run most USB devices. It may be possible to run a USB keyboard or mouse, but that is about all it will have the power to supply. The USB Host port is HS only and does not support LS or FS devices without a hub.

Figure 6 below shows the location of the USB Host connector.
7.3 Connecting Optional Power

An optional DC supply can be used to power the BeagleBoard by plugging it into the power jack of the BeagleBoard. The power supply is not provided with the BeagleBoard, but can be obtained from various sources. You need to make sure the supply is a regulated 5V supply. Figure 7 shows where to install the power supply into the power jack.

![Figure 7. DC Power Connection](image)

The power supply must have a 2.1mm I.D x 5.5mm O.D. x 9.5mm and can be either straight or right angle. Connecting anything other than 5V will result in damage to the board. If you are using the USB OTG port in the OTG or host mode, you must have an external DC supply powering the BeagleBoard.

It is highly recommended that on the Rev C2 version of the board that an external power supply or double USB cable be used if the USB Host is to be used. Most USB supplies will not be able to supply the required current over a single USB port.
7.4 Connecting JTAG

A JTAG emulator can be used for advanced debugging by connecting it to the JTAG header on the BeagleBoard. Only the 14pin version of the JTAG is supported and if a 20pin version is needed, you will need to contact your emulator supplier for the appropriate adapter. **Figure 8** shows the connection of the JTAG cable to the BeagleBoard.

**Figure 8. BeagleBoard JTAG Connection**

DO NOT expose the JTAG header to 3.3V. It supports 1.8V only.
7.5 Connecting Serial Cable

In order to access the serial port of the BeagleBoard a flat cable is required to connect to a PC. The adapter will not plug directly into the PC and will require an external Female to Female twisted cable (Null Modem) in order to connect it to the PC. The ribbon cable is not supplied with the BeagleBoard but can be obtained from numerous sources. **Figure 9** shows where the ribbon cable is to be installed.

![Serial Port](image-url)
7.6 Connecting S-Video

An S-Video cable can be connected to the BeagleBoard and from there is can be connected to a TV or monitor that supports an S-Video input. This cable is not supplied with the BeagleBoard. **Figure 10** shows the connector for the S-Video cable.

![Figure 10. BeagleBoard S-Video Connection](image)
7.7 Connecting DVI-D Cable

In order to connect the DVI-D output to a monitor, a HDMI to DVI-D cable is required. This cable is not supplied with BeagleBoard but can be obtained through numerous sources. Figure 11 shows the proper connection point for the cable.

![Figure 11. BeagleBoard DVI-D Connection](image)

Only the digital portion of HDMI is supported on the BeagleBoard.
7.8 Connecting Stereo Out Cable

An external Audio output device, such as external stereo powered speakers, can be connected to the BeagleBoard via a 3.5mm jack. The audio cables are not provided with BeagleBoard, but can be obtained from just about anywhere. **Figure 12** shows how the cable connected to the stereo out jack.
7.9 Connecting Stereo In Cable

External Audio input devices, such as a powered microphone or the audio output of a PC or MP3 player, can be connected to the via a 3.5mm jack. The audio cables are not provided with BeagleBoard, but can be obtained from just about any source. Figure 13 shows how the cable is connected to the stereo input jack.

Figure 13. BeagleBoard Audio In Cable Connection
7.10 Indicator Locations

There are four green indicators on the BeagleBoard. One of them, POWER, indicates that the main supply is active. The other three can be controlled by the software. **Figure 14** shows the location of each indicator.

![BeagleBoard Indicator Locations](image)

**Figure 14.** BeagleBoard Indicator Locations
7.11 Button Locations

There are two buttons on the BeagleBoard; the **RESET** button when pressed will force a full board reset and the **USER** button which can be used by the SW for user interaction. If the user holds the **USER** button down while pressing and releasing the **RESET** button, the BeagleBoard will enter the ROM boot loader mode. **Figure 15** shows the location of the buttons.

![Figure 15. BeagleBoard Button Location](image)
7.12 SD/MMC Connection

The SD/MMC connector can be used for Memory or SDIO type cards. This is a full size connector and will support various cards. Whether a particular card is supported or not, is dependent on the available SW drivers. Figure 16 shows the location of the SD/MMC connector.

Figure 16. BeagleBoard SD/MMC Location
7.13 LCD Connection (Rev C2 Only)

There are two headers provided to allow access to the LCD signals on the Beagle. These headers are 2x10 headers with a spacing of .05 (1.27mm) pitch. How these connectors are used is determined by the design of the adapter board. Figure 17 shows the location of the LCD headers on the Beagle.

Figure 17. BeagleBoard LCD Header Location
8.0 BeagleBoard System Architecture and Design

This section provides a high level description of the design of the BeagleBoard and its overall architecture.

8.1 System Block Diagram

Figure 18 is the high level block diagram of the BeagleBoard. If you will notice, the block diagram is configured to match the component placement of the BeagleBoard.

![BeagleBoard High Level Block Diagram](image)

Figure 18. BeagleBoard High Level Block Diagram

Figure 19 shows the location of the components as shown in the block diagram and is of the full assembly. The expansion and DC connectors are not provided on the Revision A version of the BeagleBoard. The Revision B versions contain the DC connector, but not the USB Host port. Rev C2 does contain the USB Host and the DC connector.
There are no key components on the back of the BeagleBoard, but Figure 20 has been provided for completeness.
This remainder of this section describes in detail the architecture and design of the BeagleBoard.

You will notice certain things in this section.

- The schematic has been created for each section showing only the pertinent components and their connections.
- The pin names differ from the actual schematic. For ease of reading, the names have been truncated to only show the specific functions of that pin as used in the design.
8.2 Input Power

There are two possible sources of the 5V required by the BeagleBoard. It can come from the USB OTG port connected to a PC, powered USB HUB, or a 5V DC supply. The USB supply is sufficient to power the BeagleBoard. However, depending on the load needed by the expansion port on BeagleBoard, additional power may be required. This is where the DC supply comes in to play.

**WARNING:** DO NOT PLUG IN ANYTHING BUT 5V TO THE DC CONNECTOR OR THE BOARD WILL BE DAMAGED!

It should also be noted that if an OTG configuration is used, for example tying two BeagleBoards together via a UBS OTG cable, both of the BeagleBoards must be powered by the DC supply. If the OTG port is used as a Host port, then the DC supply must also be used.

**Figure 21** is the design of the power input section.

![Figure 21. Input Power Section](image)

8.2.1 USB DC Source

The USB specification requires that the current consumed prior to enumeration be limited to 100mA @ 5V (500mW). The 5V DC from the USB is routed through the TPS2141
switch to insure that this requirement is met as uncharged capacitors on the BeagleBoard can exhibit a large current drain during start up that could exceed this requirement. The TPS2141 is a USB 2.0 Specification-compatible IC containing a dual-current limiting power switch and an adjustable low dropout regulator (LDO). Both the switch and LDO limit inrush current by controlling the turn on slew rate. The dual-current-limiting feature of the switch allows USB peripherals to utilize high-value capacitance at the output of the switch, while keeping the inrush current low.

During turn on, the switch limits the current delivered to the capacitive load to less than 100 mA. When the output voltage from the switch reaches about 93% of the input voltage, the switch power good output goes high, and the switch current limit increases to 800mA (minimum), at which point higher current loads can be turned on. The higher current limit provides short circuit protection while allowing the peripheral to draw maximum current from the USB bus.

When in the USB powered mode and no DC supply is connected, the TPS2141 is enabled, allowing the power to be supplied to the board through the integrated switch inside the TPS2141.

New on the REV B4 and B5 design is the addition of a 4.7uf capacitor across D3. This is provided to insure that the voltage supplied by the TPS65950 is clean when in the host mode. There have been some cases where the hub would not connect due to excessive noise on the supply.

### 8.2.2 Wall Supply Source

A wall supply can be used to provide power to the board. A regulated 5V DC supply of at least 500mA is required. It needs to have a 2.1mm plug with a center hot configuration.

**WARNING:** DO NOT PLUG IN ANYTHING BUT 5V TO THE DC CONNECTOR OR THE BOARD WILL BE DAMAGED!

In the event that a higher DC load is required due to the addition of a Daughtercard a higher current supply can be used. The maximum current should not exceed 2A.

### 8.2.3 DC Source Control

Unlike when powering from the USB OTG port, in the case of the DC voltage, the current limiting is not required. As long as the DC supply is not connected, the switch for the USB is enabled. When the DC supply is plugged in, the switch is disabled because the ground is removed from pin 5 of the TPS2141. This insures that the 5V from the USB is not connected by disabling the internal FET. In the case where there is no USB plugged in, there is no 5V available to be routed so the removal of the pullup in pin 5 has no affect.
When in the DC mode of operation, the USB OTG can be used in the Host or Client modes. The TPS65950 will be responsible for handling the supply of the VBUS_5V0 rail in the OTG or Host modes. As this is limited to 100mA, a powered hub must be used to support peripherals on the OTG port.

### 8.2.4 3.3V Supply

The TPS2141 has an integrated 3.3V LDO which is being used to supply the 3.3V as required on the BeagleBoard for the DVI-D interface and the UART. The input to the LDO is supplied by the main DC_5V. This insures that the power to the LDO can be supplied by either the USB or the DC wall supply and that the current measurement includes the 3.3V supply.

### 8.2.5 Meter Current Measurement

Jumper J2 is a set of pads that can facilitate the installation of a .1 x .1 header. This allows for the voltage drop across the resistor to be measured using a meter, providing a way to measure the current consumption of the BeagleBoard from the main voltage rails, either USB or DC. The resistor, R6, is a .1 ohm resistor across which the voltage is measured. The reading you get is .1mV per mA of current.

### 8.2.6 Processor Current Measurement (Rev C2 Only)

The resistor across J2 can also be used to measure the current of the board by reading the voltage drop across R6. There are two pairs of resistors provided on the TPS65950 that measure the voltage on either side of R6. This is done via the I2C control bus to the TPS65950 from the OMAP3530 processor. These values along with resistance of R6, are used to calculate the current consumption of the board. Figure 22 is the schematic of the measurement circuitry.

The maximum value that can be input to the ADC inputs is based on the setting of the VINTANA2.OUT voltage rail which defaults to 2.5V. In order to prevent the voltage levels from exceeding this value a pair of resistors of 12K and 10K is used to scale the voltage down.
This results in a value that is 46% of the actual value. So, for a maximum value of 5.25V, the voltage read would be 2.415V which keeps it below the 2.5V limit.

The voltage drop across $R6$ will be small as the value of the resistor is 0.1 ohms. For every 100 mA of current a voltage of 0.01V will be detected. In order to determine the actual power, the input voltage and the voltage drop must be measured.

### 8.3 Power Conditioning

This circuitry regulates the DC input to a nominal 4.2VDC level. This is required in order to meet the maximum DC voltage level as specified by the TPS65950 Power Management device which is 4.7V. Using 4.2V gives us some margin and meets the nominal 4.2V rating of the TPS65950.

Figure 23 is the power conditioning section of the BeagleBoard.
The **TPS65950** provides the main power rails to the board and has a maximum limit of 4.8V on its VBAT input and a nominal of 4.2V. **U2**, the **TPS73701**, is used to convert the DC_5V, which can come from a DC wall supply or the USB, to 4.2V to meet this requirement. The **TPS737701** is a linear low-dropout (LDO) voltage regulator and is thermal shutdown and current limit protected. It has the ability to deliver 1A of current, although this is far and above the requirements of the board. By adjusting the values of **R7** and **R8**, the actual voltage can be adjusted if needed. The LED **D5** is an indication that the 4.2V is present.

### 8.4 TPS65950 Reset and Power Management

The **TPS65950** supplies several key functions on the BeagleBoard. This section covers a portion of those functions centered on the power and reset functions. Included in this section is:

- Main Core Voltages
- Peripheral Voltages
- Power Sequencing
- Reset
- Current measurement via SW

The other functions are covered in other sections in this document and are grouped by their overall board functions. The explanation of the various regulators found on the TPS65950 is based upon how they are used in the board design and are not intended to reflect the overall capability of the TPS65950 device. Please refer to the TPS65950 documents for a full explanation of the device operation.
8.4.1 Main Core Voltages

The TPS65950 supplies the three main voltage rails for the OMAP3530 processor and the board:

- VOCORE_1V3 (1.2V)
- VDD2 (1.3V)
- VIO_1V8 (1.8V)

The VOCORE_1V3 defaults to 1.2V at power up, but can be adjusted by software to the 1.3V level. Figure 24 is the interfacing of the TPS65950 to the system as it provides the three main rails.

8.4.2 Main DC Input

The main supply to the TPS65950 for the main rails is the VBAT rail which is a nominal 4.2V. Each rail has a filter cap of 10uF connected to each of the three inputs. A .1uF cap is also provided for high frequency noise filtering.

8.4.3 OMAP3530 I2C Control

The various components in the TPS65950 are controlled from the OMAP3530 via the I2C interface. I2C_0 is used to control the TPS65950 device.

8.4.4 VIO_1V8

The VIO_1V8 rail is generated by the TPS65950 VIO regulator. The VIO output is a stepdown converter with a choice of two output voltage settings: 1.8 V or 1.85 V. The voltage is set by configuring the VSEL bit (VIO_VSEL[0]). When the VSEL bit is set to 0, the output voltage is 1.8 V, and when it is set to 1, the output voltage is 1.85 V.

When the TPS65950 resets, the default value of this LDO is 1.80 V; the OMAP3530 must write 1 to the VSEL field to change the output to 1.85 V. The default for the BeagleBoard is 1.8V. This regulator output is used to supply power to the system memories and I/O ports. It is one of the first power supplies to be switched on in the power-up sequence. VIO does not support the SmartReflex voltage control schemes. VIO can be put into sleep or off mode by configuring the SLEEP_STATE and OFF_STATE fields of the VIO_REMAP register.
Figure 24. Main Power Rails
8.4.5 Main Core Voltages Smart Reflex

VDD1 and VDD2 regulators on the TPS65950 provide SmartReflex-compliant voltage management. The SmartReflex controller in the OMAP3530 interfaces with the TPS65950 counterpart through the use of a dedicated I2C bus. The OMAP3530 computes the required voltage and informs the TPS65950 using the SmartReflex I2C interface.

SmartReflex control of the VDD1 and VDD2 regulators can be enabled by setting the SMARTREFLEX_ENABLE bit (DCDC_GLOBAL_CFG[3]) to 1. To perform VDD1 voltage control through the SmartReflex interface, the TPS65950 provides the VDD1_SR_CONTROL register. The MODE field of the VDD1_SR_CONTROL register can be set to 0 to put VDD1 in an ACTIVE state; setting the field to 1 moves VDD1 to a SLEEP state. VDD1 output voltage can be programmed by setting the VSEL field of the VDD1_SR_CONTROL register. The VDD1 output voltage is given by VSEL*12.5 mV + 600 mV.

8.4.6 VOCORE_1V3

The VOCORE_1V3 rail is supplied by the VDD1 regulator of the TPS65950. The VDD1 regulator is a 1.1A stepdown power converter with configurable output voltage between 0.6 V and 1.45 V in steps of 12.5 mV. This regulator is used to power the OMAP3530 core.

The OMAP3530 can request the TPS65950 to scale the VDD1 output voltage to reduce power consumption. The default output voltage at power-up depends on the boot mode settings, which in the case of the BeagleBoard is 1.2V. The output voltage of the VDD1 regulator can be scaled by software or hardware by setting the ENABLE_VMODE bit (VDD1_VMODE_CFG[0]). In each of these modes, the output voltage ramp can be single-step or multiple-step, depending on the value of the STEP_REG field of the VDD1_STEP[4:0] register. The VOCORE_1V3 rail should be set to 1.3V after boot up.

Apart from these modes, the VDD1 output voltage can also be controlled by the OMAP3530 through the SmartReflex I2C interface between the OMAP3530 and the TPS65950. The default voltage scaling method selected at reset is a software-controlled mode. Regardless of the mode used, VDD1 can be configured to the same output voltage in sleep mode as in active mode by programming the DCDC_SLP bit of the VDD1_VMODE_CFG[2] register to 0. When the DCDC_SLP bit is 1, the sleep mode output voltage of VDD1 equals the floor voltage that corresponds to the VFLOOR field (VDD1_VFLOOR[6:0]).

8.4.7 VDD2

The VDD2 voltage rail is generated by the TPS65950 using the VDD2 regulator. The VDD2 regulator is a stepdown converter with a configurable output voltage of between
0.6 V and 1.45 V and is used to power the OMAP3530 core. VDD2 differs from VDD1 in its current load capabilities with an output current rating of 600 mA in active mode.

The VDD2 provides different voltage regulation schemes. When VDD2 is controlled by the VMODE2 signal or with the SmartReflex interface, the range of output voltage is 0.6 V to 1.45 V. The use of the VMODE2 signal and the VDD2_VMODE_CFG, VDD2_STEP, VDD2_FLOOR, and VDD2_ROOF registers is similar to the use of the corresponding signals and registers for VDD1. VDD2 shares the same SmartReflex I2C bus to provide voltage regulation. The VDD2_SR_CONTROL register is provided for controlling the VDD2 output voltage in SmartReflex mode.

When the VDD2 is used in software-control mode, the VSEL (VDD2_DEDICATED[4:0]) field can be programmed to provide output voltages of between 0.6 V and 1.45 V. The output voltage for a given value of the VSEL field is given by VSEL*12.5 mV + 600 mV. If the VSEL field is programmed so that the output voltage computes to more than 1.45 V, the TPS65950 sets the VDD2 output voltage to 1.5 V.

8.5 Peripheral Voltages

There are five additional voltages used by the system that are generated by the TPS65950. These are:

- VDD_PLL2
- VDD_PLL1
- VDAC_1V8
- VDD_SIM
- VMMC1

Figure 25 shows the peripheral voltages supplied by the TPS65950.

8.5.1 VDD_PLL2

This programmable LDO is used to power the OMAP3530 PLL circuitry. The VPLL2 LDO can be configured through the I2C interface to provide output voltage levels of 1.0 V, 1.2 V, 1.3 V, or 1.8 V, based on the value of the VSEL field (VPLL1_DEDICATED[3:0]). On the board this rail is used to power DVI output for pins DSS_DATA(0:5), DSS_DATA(10:15) and DSS_DATA(22:23). The VPLL2 must be set to 1.8V for proper operation of the DVI-D interface.

8.5.2 VDD_PLL1

The VPLL1 programmable LDO regulator is low-noise, linear regulator used for the OMAP3530 PLL supply. The VDD_PLL1 rail is initialized to 1.8V.
8.5.3 VDAC_1V8

The VDAC programmable LDO regulator is a high-PSRR, low-noise, linear regulator that powers the OMAP3530 dual-video DAC. It is controllable with registers via I2C and can be powered down if needed. The VDAC LDO can be configured to provide 1.2V, 1.3
V, or 1.8 V in on power mode, based on the value of the VSEL field (VDAC_DEDICATED[3:0]). The **VDAC_1V8** rail should be set to 1.8V for the BeagleBoard.

### 8.5.4 VDD_SIM

This voltage regulator is a programmable, low dropout, linear voltage regulator supplying the bottom 4 bits of the 8 bit SD/MMC card slot. The VSEL field (VSIM_DEDICATED[3:0]) can be programmed to provide output voltage of 1.0 V, 1.2 V, 1.3 V, 1.8 V, 2.8 V, or 3.0 V and can deliver up to 50mA. The default output voltage of this LDO as directed by the **TPS65950** boot pins is 1.8V.

### 8.5.5 VMMC1

The **VMMC1** LDO regulator is a programmable linear voltage converter that powers the MMC1 slot and includes a discharge resistor and overcurrent protection (short-circuit). This LDO regulator can also be turned off automatically when the MMC card extraction is detected. The VMMC1 LDO is powered from the main **VBAT** rail. The **VMMC1** rail defaults to 3.0V as directed by the **TPS65950** boot pins and will deliver up to 220mA. It can be set to 3.0V in the event 3V cards are being used.

### 8.5.6 Boot Configuration

The boot configuration pins on the **TPS65950** determine the power sequence of the device. For the OMAP3530 support, the boot pin configuration is fixed at:

- **BOOT0** tied to **VBAT**
- **BOOT1** tied to Ground.

### 8.5.7 RTC Backup Battery

New in the Rev C3 version is an optional battery to backup the Real Time Clock that is in the TPS65950. The board does not come equipped with the battery. The battery can be purchased from DigiKey or other component suppliers. When the battery is not installed, R66 must be installed. You must make sure that prior to installing the battery that R66 is removed.

Refer to section 9.11 for information on the battery selection and installation.
8.5.8 Power Sequencing

Based on the boot configuration pins, the TPS65950 knows the type of OMAP processor that it needs to support, in this case the OMAP3530. The voltages are ramped in a sequence that is compatible with the OMAP3530 processor. Figure 26 is the sequence that the power rails, clocks, and reset signal come up.

![Diagram of Power Sequencing]

**Figure 26. Power Sequencing**
8.5.9 Reset Signals

The BeagleBoard uses two distinct reset circuits:

- Warm Reset
- Cold Reset

Figure 27 shows the connections for the Warm and Cold Reset.

8.5.9.1 Warm Reset

The warm reset is generated by the OMAP3530 processor on power up. The nRESWARM signal is a bidirectional reset. When an internal reset occurs, nRESWARM goes low and resets all the peripherals and the TPS65950. The TPS65950 can be configured to perform a warm reset of the device to bring it into a known defined state by detecting a request for a warm reset on the NRESWARM pin. The minimum duration of the pulse on the nRESWARM pin should be two 32-kHz clock cycles. The nRESWARM output is open-drain; consequently, an external pullup resistor is required. There is no way for the user to generate a warm reset on the BeagleBoard.

8.5.9.2 Cold Reset

On power up as shown in Figure 27, the TPS65950 generates nRESPWRON, power on reset. The signal from the TPS65950 is an output only and is not an open drain signal. By running the signal through a buffer, SN74LVC2G07, the signal becomes open drain, which requires a pullup on the signal. This will allow the nRESPWRON signal to be pulled low, by pressing the reset switch S2, to force a reset to the OMAP3530 processor and to any device on the expansion card that require a reset.
It also allows for the reset signal to be pulled low or held low for an extended time by circuitry on the expansion card if needed.

### 8.5.9.3 PWRON

You will notice another signal on the TPS65950 called PWRON. This signal is referenced in the TPS65950 documentation. In the BeagleBoard design it is not used but it is pulled high to insure the desired operation is maintained.

### 8.5.10 mSecure Signal (Rev C2)

The BeagleBoard has a new feature called mSecure. This signal provides for protection of the RTC registers in the TPS65950 be disabling that function via a control signal form the OMAP3530 processor. This signal was not available from the OMAP3530 on the Rev B and earlier boards because the signal was used on the same pins as the ULPI interface for the USB Host port. When that function was moved to port 2, this signal became available.

For more information on the operation on the signal, please refer to the OMAP3530 Technical Reference Manual.
8.6 OMAP3530 Processor

The heart of BeagleBoard is the OMAP3530 processor. Figure 28 is a high level block diagram of the OMAP3530.

![Figure 28. OMAP3530 Block Diagram](image)

8.6.1 Overview

The OMAP3530 high-performance, multimedia application device is based on the enhanced OMAP™ 3 architecture and is integrated on TI's advanced 65-nm process technology. The OMAP3530 architecture is configured with different sets of features in different tier devices. Some features are not available in the lower-tier devices. For more information, refer to the OMAP3530 Technical Reference Manual (TRM). The architecture is designed to provide best-in-class video, image, and graphics processing sufficient to various applications.

The OMAP3530 supports high-level operating systems (OSs), such as:
- Windows CE
This OMAP3530 device includes state-of-the-art power-management techniques required for high-performance low power products. The OMAP3530 supports the following functions and interfaces on the BeagleBoard:

- Microprocessor unit (MPU) subsystem based on the ARM Cortex-A8™ microprocessor
- POP Memory interface
  - 2Gb MDDR (256Mbytes)
  - 2Gb NAND Flash (256Mbytes)
- 24 Bit RGB Display interface (DSS)
- SD/MMC interface (2)
- USB OTG interface
- NTSC/PAL/S-Video output
- Power management
- Serial interface
- I²C interface
- I²S Audio interface (McBSP2)
- Expansion McBSP1
- JTAG debugging interface

### 8.6.2 SDRAM Bus

The SDRAM bus is not accessible on the BeagleBoard. Its connectivity is limited to the POP memory access on the top of the OMAP3530 and therefore is only accessible by the SDRAM memory.

The base address for the DDR SDRAM in the POP device is **0x8000 0000**.

### 8.6.3 GPMC Bus

The GPMC bus is not accessible on the BeagleBoard. Its connectivity is limited to the POP memory access on the top of the OMAP3530 and therefore is only accessible by the NAND memory.

The memory on the GPMC bus is NAND and therefore will support the classical NAND interface. The address of the memory space is programmable. Please consult the Software Reference for more information.
8.6.4 DSS Bus

The display subsystem provides the logic to display a video frame from the memory frame buffer in SDRAM onto a liquid-crystal display (LCD) display via the DVI-D interface or to a standalone LCD panel via the LCD interface connectors. The logic levels of the LCD expansion connectors are 1.8V so it will require buffering of the signals to drive most LCD panels. The DSS is configured to a maximum of 24 bits, but can be used at lower bit modes if needed.

8.6.5 McBSP2

The multi-channel buffered serial port (McBSP) McBSP2 provides a full-duplex direct serial interface between the OMAP3530 and the audio CODEC in the TPS65950 using the I2S format. Only four signals are supported on the McBSP2 port. Figure 29 is a depiction of McBSP2.

8.6.6 McBSP1

McBSP1 provides a full-duplex direct serial interface between the OMAP3530 and the expansion interface. There are 6 signals supported on McBSP1, unlike the 4 signals on the other ports. Figure 30 is a diagram of McBSP1.
8.6.7 McBSP3

McBSP3 provides a full-duplex direct serial interface between the OMAP3530 and the expansion interface. Figure 31 is a diagram of McBSP3.

8.6.8 Pin Muxing

On the OMAP3530, the majority of pins have multiple configurations that the pin can be set to. In essence, the pin can become different signals depending on how they are set in the software. In order for the BeagleBoard to operate, the pins used must be set to the correct signal. In some cases, the default signal is the correct signal. Each pin can have a
maximum of 7 options on the pin. This is called the pin mode and is indicated by a three bit values (0:3).
In the case of the signals going to the expansion connector, the settings required for those pins depends on how they are to be used. For an explanation of the options, please refer to the Expansion Header section.

**Table 4** is a list of all of the signals used on the OMAP3530 for the BeagleBoard and the required mode setting for each pin. Where the default setting is needed, it will be indicated. The USER notation under mode indicates that this is an expansion signal and can be set at the discretion of the user. A FIXED indicates that there is only one function for that signal and that it cannot be changed.

### 8.6.9 GPIO Mapping
There are a number of GPIO pins from the OMAP3530 that are used on the BeagleBoard design. Table 5 shows which of these GPIO pins are used in the design and whether they are inputs or outputs. While GPIO pins can be used as interrupts, the table only covers the GPIO pin mode. If it is an interrupt, then it is covered in the interrupt section.

Other signals, such as those that connect to the expansion connector, may also be set as a GPIO pin. For information on those, refer to the Expansion Connector section.

#### 8.6.10 Interrupt Mapping

There are a small number of pins on the OMAP3530 that act as interrupt. Some of these interrupts are connected to the TPS65950 and their status is reflected through the main TPS65950 interrupt. Table 6 lists the interrupts.

#### 8.7 POP Memory Device

The OMAP3530 uses what is called POP (Package-on-Package) memory. The memory is a MCP (Multi Chip Package) that contains both the Mobile DDR SDRAM and the NAND Flash. Figure 32 shows the POP Memory concept.
The Memory device mounts on top of the OMAP3530 device. The configuration used on the board is a 2Gb NAND Flash plus 2Gb MDDR SDRAM device from Micron.

8.8 System Clocks

There are three clocks needed for the operation of the BeagleBoard, 32KHz, 26MHz and McBSP_CLKS. Figure 33 shows the components that make up the System Clocks.

![System Clocks Diagram]

Figure 33. System Clocks

8.8.1 32KHz Clock

The 32KHz clock is needed for the TPS65950 and the OMAP3530 and is provided by the TPS65950 via the external 32KHz crystal, Y2. The TPS65950 has a separate output from the crystal to drive the OMAP3530 that buffers the resulting 32-kHz signal and provides it as 32KCLKOUT, which is provided to the OMAP3530 on ball AE25. The default mode of the 32KCLKOUT signal is active, but it can be disabled if desired under SW control.

The 32.768-kHz clock drives the RTC embedded in the TPS65950. The RTC is not enabled by default; the host processor must set the correct date and time to enable the RTC.

8.8.2 26MHz Clock

This section describes the 26MHz clock section of the BeagleBoard.
8.8.2.1 26MHz Source

The beagle is designed to support two suppliers of the 26MHz oscillator. The 26MHz clock is provided by an onboard oscillator, Y1. The TPS65950 receives the external HFCLKIN signal on ball A14 and uses it to synchronize or generate the clocks required to operate the TPS65950 subsystems. The TPS65950 must have this clock in order to function to the point where it can power up the BeagleBoard. This is the reason the 26MHz clock is routed through the TPS65950.

8.8.2.2 TPS65950 Setup

When the TPS65950 enters an active state, the OMAP3530 must immediately indicate the HFCLKIN frequency (26 MHz) by setting the HFCLK_FREQ bit field (bits [1:0]) in the CFG_BOOT register of the TPS65950. HFCLK_FREQ has a default of not programmed, and in that condition, the USB subsection does not work, the three DCDC switching supplies (VIO, VDD1, and VDD2) operate from their free-running 3-MHz (RC) oscillators, and the PWR registers are accessed at a default 1.5-M byte. HFCLK_FREQ must be set by the OMAP3530 during the initial power-up sequence. On BeagleBoard, this is done by the internal boot ROM on startup.

8.8.2.3 OMAP3530 26MHz

The 26MHz clock for the OMAP3530 is provided by the TPS65950 on ball R12 through R38, a 33 ohm resistor is providing to minimize any reflections on the clock line. The clock signal enters via ball AE17 on the OMAP3530.

8.8.3 McBSP_CLKS

An additional clock is also provided by the TPS65950 called McBSP_CLKS. This clock is provided to the OMAP3530 in order to insure synchronization of the I2S interface between the OMAP3530 and the TPS65950.

8.9 USB OTG Port

The main USB port on the BeagleBoard is a USB OTG (On-the-Go) port. It can be used as an OTG port or Client port. The main use is as a client port, as that is the mode that will supply the power needed to power the BeagleBoard.

NOTE: In order to use the OTG in the Host mode, the BeagleBoard must be powered from the DC supply.
8.9.1 USB OTG Overview

USB OTG is a supplement to the USB 2.0 specification. The standard USB uses a master/slave architecture, a USB host acting as a master and a USB peripheral acting as a slave. Only the USB host can schedule the configuration and data transfers over the link. The USB peripherals cannot initiate data transfers, they only respond to instructions given by a host.

USB OTG works differently in that gadgets don't need to be pure peripherals because they can sometimes act as hosts. An example might be connecting a USB keyboard or printer to BeagleBoard or a USB printer that knows how to grab documents from certain peripherals and print them. The USB OTG compatible devices are able to initiate the session, control the connection and exchange Host/Peripheral roles between each other.

The USB OTG supplement does not prevent the use of a hub, but it describes role swapping only in the case of a one-to-one connection where two OTG devices are directly connected. If a standard hub is used, the supplement notes that using it will lead to losing USB OTG role-swap capabilities making one device as the Default-Host and the other as the Default-Peripheral until the hub is disconnected.

The combination of the OMAP3530 and the TPS65950 allows the BeagleBoard to work as an OTG device if desired. The primary mode of operation however, is intended to be a client mode in order to pull power from the USB host which is typically a PC. As the Rev B does not have a Host USB port, this port will be used as a Host port in many applications.

8.9.2 USB OTG Design

Figure 34 is the design of the USB OTG port on the BeagleBoard.
8.9.3 OTG ULPI Interface

ULPI is an interface standard for high-speed USB 2.0 systems. It defines an interface between USB link controller (OMAP3530) and the TPS65950 that drives the actual bus. ULPI stands for UTMI+ low pin interface and is designed specifically to reduce the pin count of discrete high-speed USB PHYs. Pin count reductions minimize the cost and footprint of the PHY chip on the PCB and reduce the number of pins dedicated to USB for the link controller.

Unlike full- and low-speed USB systems, which utilize serial interfaces, high-speed requires a parallel interface between the controller and PHY in order to run the bus at 480Mbps. This leads to a corresponding increase in complexity and pin count. The ULPI used on the BeagleBoard keeps this down to only 12 signals because it combines just three control signals, plus clock, with an 8-bit bi-directional data bus. This bus is also used for the USB packet transmission and for accessing register data in the ULPI PHY.

8.9.3.1 OMAP3530 Interface

The controller for the ULPI interface is the OMAP3530. It provides all of the required signals to drive the interface. Table 7 describes the signals from the OMAP3530 that are used for the USB OTG interface.

<table>

8.9.4 OTG Charge Pump

When the TPS65950 acts as an A-device, the USB charge pump is used to provide 4.8 V/100 mA to the VBUS pin. When the TPS65950 acts as a B-device, the USB charge pump is in high impedance. If used in the OTG mode as an A-device, the BeagleBoard will need to be powered from the DC supply. If acting as a B-device, there will not be a voltage source on the USB OTG port to drive the BeagleBoard. Table 9 describes the charge pump pins.

Table 9. USB OTG Charge Pump Pins

<table>
<thead>
<tr>
<th>Signal</th>
<th>Description</th>
<th>Type</th>
<th>Ball</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP.IN</td>
<td>The charge pump input voltage. Connected to VBAT.</td>

<td>The charge pump flying capacitor minus.</td>
<td>O</td>
<td>T6</td>
</tr>
<tr>
<td>CP.GND</td>
<td>The charge pump ground.</td>
<td>GND</td>
<td>R6</td>
</tr>
</tbody>
</table>

The charge pump is powered by the VBAT voltage rail. The charge pump generates a 4.8-V (nominal) power supply voltage to the VBUS pin. The input voltage range is 2.7 V to 4.5 V so the 4.2V VBAT is within this range. The charge pump operating frequency is 1 MHz. The charge pump integrates a short-circuit current limitation at 450 mA.

8.9.5 OTG USB Connector

The OTG USB interface is accessed through the miniAB USB connector. If you want to use the OTG port as a USB Host, pin 4 of the connector must be grounded. The Rev C2 version of Beagle provides jumper pad, J6 that allow for a small piece of solder to be placed on the pads to perform this function. It should be noted, that with the addition of the USB Host port on the Rev C2 Beagle, the need to convert the OTG port to a host mode is greatly diminished.
8.9.6 OTG USB Protection

Each lead on the USB port has ESD protection. In order for the interface to meet the USB 2.0 Specification Eye Diagram, these protection devices must be low capacitance.

8.10 USB Host Port

The Rev C2 is equipped with a High Speed USB Host interface connected to the ULPI port 2 on the OMAP3530. It uses a SMSC PHY as the physical interface and provides power control to the USB connector. **Figure 35** is the design of the USB Host port.

**Figure 35. USB Host Design**

8.10.1 Host USB OMAP3 Interface

The interface to the OMAP3 is the HSUSB2 interface. The signals used on this interface are contained in **Table 10**.

**Table 10. USB Host Port OMAP Signals**

<table>

</tbody>
</table>
The **husb2_clk** signal is an output only and is used to support a HS USB PHY that supports an input clock mode. The SMSC PHY device supports this mode and is used on the Beagle.

### 8.10.2 Host USB PHY

The PHY used in the design is a USB3326 series device from SMSC. The USB3326 is a highly integrated Hi-Speed USB2.0 Transceiver (PHY) that meets all of the electrical requirements to be used as a Hi-Speed USB Host, Device, or an On-the-Go (OTG) transceiver. In this design, only the host mode of operation is being supported. The USB3326 uses the industry standard UTMI+ Low Pin Interface (ULPI) to connect the USB PHY to the OMAP3. ULPI uses a method of in-band signaling and status byte transfers between the Link and PHY to facilitate a USB session with only 12 pins.

In order to interface to the OMAP3, the device must be used in the 60MHz clock mode. This is done by tying the **CLKOUT** signal on the USB PHY to **VIO_1V8**. The clock for the PHY is derived from the 60MHz signal generated by the OMAP3. All of the signals and their functions align with the descriptions found in the OMAP3 Interface section.

The USB3326 device requires two voltages, the **VIO_1V8** rail to power the I/O rails and the **VBAT**, which needs to be between 3.1V and 5.1V, to power the rest of the device. On the board the **VBAT** is a regulated 4.2V DC. The 3.3V rail for the device is generated internally and requires a filter and bypass cap to be connected externally.

The **RBIAS** block in the PHY consists of an internal bandgap reference circuit used for generating the driver current and the biasing of the analog circuits. This block requires an external 8.06KΩ, 1% tolerance, reference resistor connected from **RBIAS** to ground. The nominal voltage at **RBIAS** is 0.8V and therefore the resistor will dissipate approximately 80µW of power.

The USB3326 can detect **ID** grounded and **ID** floating to determine if an A or B cable has been inserted. The A plug will ground the **ID** pin while the B plug will float the **ID** pin. As we are not using this device to support the OTG protocol but instead as a host device, we ground the **ID** pin to force it into a Host mode at all times. The **ID** signal is not present on the USB connector.

The USB3326 transceiver fully integrates all of the USB termination resistors on both **DP** and **DM**. This includes 1.5kΩ pull-up resistors, 15kΩ pull-down resistors and the 45Ω high speed termination resistors. These resistors require no tuning or trimming.
8.10.3 Host USB Connector

The USB connector used is a Type A receptacle. It provides connections for four signals, DP, DM, VBUS, and Ground. This is the same connector you will see on the back of a USB hub. You will notice that there is no external ESD devices on the connector. The ESD protection is integrated into the USB PHY.

8.10.4 Host USB Power Control

Power is provided through the USB Host connector to power devices that are plugged in. This power can be controlled by the OMAP3 by controlling the TPS2061 power switch.

The TPS2061 power-distribution switch is intended for applications where heavy capacitive loads and short-circuits are likely to be encountered. This device incorporates a 70-mW N-channel MOSFET power switch. Gate drive is provided by an internal charge pump designed to control the power-switch rise times and fall times to minimize current surges during switching. The switch is controlled by the TPS65950 using the LED.A signal. The OMAP3 uses the I2C interface to activate the signal in the TPS65950.

The amount of available current to be supplied depends on the remaining current available from the PC when in USB mode or the DC supply. The switch will not be able to supply more current than is available form the source.

The TPS2061 also provides an overcurrent indicator and protection circuit. When the output load exceeds the current-limit threshold or a short is present, the device limits the output current to a safe level by switching into a constant-current mode, pulling the overcurrent (OC) logic output low. This is read by the TPS65950 via the CD2 pin. The CD2 pin can be set to generate an interrupt to the OMAP3 to alert it of this condition.

When continuous heavy overloads and short-circuits increase the power dissipation in the switch, causing the junction temperature to rise, a thermal protection circuit shuts off the switch to prevent damage. Recovery from a thermal shutdown is automatic once the device has cooled sufficiently. Internal circuitry ensures that the switch remains off until valid input voltage is present. This power-distribution switch is designed to set current limit at 1.5 A typically. As mentioned, the amount of current available depends on the current source.

8.11 SD/MMC

The board provides an SD/MMC interface for using cards such as MMC memory cards and SDIO cards, such as cameras and Wireless LAN.

The connector supports 7 different types of cards.
SD - Secure Digital (SD) is a flash memory card format developed by Matsushita, SanDisk and Toshiba for use in portable devices. As of 2007, SD card capacities range from 8 MB to 16 GB. Several companies have announced SD cards with 32 GB. Cards with 4-32 GB are considered high-capacity. The format has proven to be very popular. However, compatibility issues between older devices and the newer 4 GB and larger cards and the SDHC format have caused considerable confusion for some users. SD card have a write protect tab to prevent the data from being overwritten. SD supports 1-bit SD, 4-bit SD, and SPI modes.

miniSD - Has the same features as the SD with the exceptions that it is in a smaller size and the support for 4-bit mode is optional amongst suppliers.

SDIO - SDIO stands for Secure Digital Input Output. SD slots can actually be used for more than flash memory cards. Devices that support SDIO can use small devices designed for the SD form factor, like GPS receivers, Wi-Fi or Bluetooth adapters, modems, Ethernet adapters, barcode readers, IrDA adapters, FM radio tuners, TV tuners, RFID readers, digital cameras, or other mass storage media such as hard drives. SDIO cards are fully compatible with SD Memory Card host controller (including mechanical, electrical, power, signaling and software). When an SDIO card is inserted into a non SDIO-aware host, it will cause no physical damage or disruption to device or host controller. It should be noted that SPI bus topology is mandatory for SDIO, unlike SD Memory and most of the SD Memory commands are not supported in SDIO. Figure 36 is an example of a SDIO camera card.

Figure 36. Example of an SDIO Card
- **MMC** - The Multi Media Card (MMC) is a flash memory card standard. Unveiled in 1997 by Siemens AG and SanDisk, it is based on Toshiba's NAND-based flash memory, and is therefore much smaller than earlier systems based on Intel NOR-based memory such as CompactFlash. MMC is about the size of a postage stamp: 24 mm x 32 mm x 1.4 mm. MMC originally used a 1-bit serial interface, but newer versions of the specification allow transfers of 4 at a time. MMCs are currently available in sizes up to and including 4 GB an 8 GB models.

- **MMCplus** - The version 4.x of the MMC standard, introduced in 2005, brought in two very significant changes to compete against SD cards. These were support for running at higher speeds (26MHz, 52MHz) than the original MMC (20MHz) or SD (25MHz, 50MHz). Version 4.x cards are fully backward compatible with existing readers but require updated hardware/software to use their new capabilities; even though the 4 bit wide bus and high-speed modes of operation are deliberately electrically compatible with SD, the initialization protocol is different, so firmware/software updates are required to allow these features to be enabled when the card is used in an SD reader.

- **MMCmobile** – Is basically the same as MMCplus except that it supports 8 bit data mode.

- **RS-MMC** – This alternate form factor is known as Reduced-Size MultiMediaCard, or RS-MMC, and was introduced in 2004. This form factor is a smaller form factor, of about half the size: 24 mm × 18 mm × 1.4 mm. RS-MMCs are simply smaller MMCs. RS-MMCs are currently available in sizes up to and including 4 GB. Nokia used to use RS-MMC in the Nokia 770 Internet Tablet. **Figure 37** is a side by side comparison of the RS-MMC and MMC card.

**Figure 37. RS-MMC and Card**

**Figure 38** is the SD/MMC interface design on the BeagleBoard.
8.11.1 MMC Power

The SD/MMC connector is supplied power from the **TPS65950** using the **VMMC1** rail. The default setting on this rail is 3.0V as set by the Boot ROM and under SW control, can be set to 1.80V for use with 1.8V cards. The maximum current this rail can provide is 220mA as determined by the TPS65950 regulator. Maximum current can be limited by the overall current available from the USB interface of the PC.

8.11.2 OMAP3530 Interface

There are no external buffers required for the SD/MC operation. The OMAP3530 provides all of the required interfaces for the SD/MMC interface.

The main features of the MMC/SD/SDIO host controller are:

- Full compliance with MMC command/response sets as defined in the *Multimedia Card System Specification*, v4.0
- Full compliance with SD command/response sets as defined in the *SD Memory Card Specifications*, v1.10d
- Full compliance with SDIO command/response sets and interrupt/read-wait mode as defined in the *SDIO Card Specification, Part E1*, v1.10
- Compliance with sets as defined in the *SD Card Specification, Part A2, SD Host Controller Standard Specification*, v1.00
- Full compliance with MMC bus testing procedure as defined in the *Multimedia Card System Specification*, v4.0
- Full compliance with CE-ATA command/response sets as defined in the *CE-ATA Standard Specification*
- Full compliance with ATA for MMCA specification
- Flexible architecture allowing support for new command structure
- Support:
  - 1-bit or 4-bit transfer mode specifications for SD and SDIO cards
  - 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards
- Built-in 1024-byte buffer for read or write
- 32-bit-wide access bus to maximize bus throughput
- Single interrupt line for multiple interrupt source events
- Two slave DMA channels (1 for TX, 1 for RX)
- Programmable clock generation
- Support SDIO Read Wait and Suspend/Resume functions
- Support Stop at block gap
- Support command completion signal (CCS) and command completion signal disable (CCSD) management as specified in the *CE-ATA Standard Specification*
The known limitations are as follows:

- No built-in hardware support for error correction codes (ECC). See the *Multimedia Card System Specification*, v4.0, and the *SD Memory Card Specifications*, v1.10d, for details about ECC.
- The maximum block size defined in the *SD Memory Card Specifications*, v1.10d that the host driver can read and write to the buffer in the host controller is 2048 bytes. MMC supports a maximum block size of 1024 bytes. Up to 512 byte transfers, the buffer in MMC is considered as a double buffering with ping-pong management; half of the buffer can be written while the other part is read. For 512 to 1024 byte transfers, the entire buffer is dedicated to the transfer (read only or write only).

*Table 11* provides a description of the signals on the MMC card.

8.11.3 Card Detect

When a card is inserted into the SD/MMC connector, the Card Detect pin is grounded. This is detected on pin P12 of the TPS65950. An interrupt, if enabled, is sent to the OMAP3530 via the interrupt pin. The SW can be written such that the system comes out of sleep or a reduced frequency mode when the card is detected.

8.11.4 Write Protect

If an SD card is inserted into the SD/MMC connector and the write protect pin is active, the Write Detect pin is grounded. This is detected GPIO_29 of the OMAP3530. The SW can then determine if the card is write protected and act accordingly.

8.11.5 8 Bit Mode

The BeagleBoard also supports the new 8-bit cards. The upper 4 bits are supplied by the VDD_SIM power rail and as such the 8-bit mode is only supported in 1.8V modes. This requires that both the VMMC1 and VDD_SIM rails must be set to 1.8V when using 8 bit cards.

8.11.6 Booting From SD/MMC Cards

The ROM code supports booting from MMC and SD cards with some limitations:

- Support for MMC/SD cards compliant with the Multimedia Card System Specification v4.2 from the MMCA Technical Committee and the Secure Digital I/O Card Specification v2.0 from the SD Association. Including high-capacity (size >2GB) cards: HC-SD and HC MMC.
- 3-V power supply, 3-V I/O voltage on port 1
- Initial 1-bit MMC mode, 4-bit SD mode.
- Clock frequency:
  - Identification mode: 400 kHz
8.12 Audio Interface

The BeagleBoard supports stereo in and out through the TPS65950 which provides the audio CODEC.

**Figure 39** is the Audio circuitry design on the BeagleBoard.

![Figure 39. Audio Circuitry](image)

### 8.12.1 OMAP3530 Audio Interface

There are five McBSP modules called McBSP1 through McBSP5 on the OMAP3530. McBSP2 provides a full-duplex, direct serial interface between CODEC inside the TPS65950. It supports the I2S format to the TPS65950. In **Table 11** are the signals used on the OMAP3530 to interface to the CODEC.

8.12.2 TPS65950 Audio Interface

The TPS65950 acts as a master or a slave for the I2S interface. If the TPS65950 is the master, it must provide the frame synchronization (I2S_SYNC) and bit clock (I2S_CLK) to the OMAP3530. If it is the slave, the TPS65950 receives frame synchronization and bit clock. The TPS65950 supports the I2S, left-justified, and right-justified data formats, but doesn’t support the TDM slave mode.

In Table 13 are all the signals used to interface to the OMAP3530.

8.12.3 Audio Output Jack

A single 3.5mm jack is provided on BeagleBoard to support external stereo audio output devices such as headphones and powered speakers.

8.12.4 Audio Input Jack

A single 3.5mm jack is supplied to support external audio inputs including stereo or mono.

8.13 DVI-D Interface
The LCD interface on the **OMAP3530** is accessible from the **DVI-D** interface connector on the board. **Figure 40** is the DVI-D interface design.

**Figure 40. DVI-D Interface**

8.13.1 OMAP3530 LCD Interface

The main driver for the DVI-D interface originates at the **OMAP3530** via the **DSS** pins. The OMAP3530 provides 24 bits of data to the DVI-D framer chip, **TFP410**. There are three other signals used to control the DVI-D that originate at the **OMAP3530**. These are **I2C3_SCL**, **I2C3_SDA**, and **GPIO_170**. All of the signals used are described in **Table 14**.

10ohm series resistors are provide in the signal path to minimize reflections in the high frequency signals from the OMAP3530 to the TFP410. These resistors are in the form of resistor packs on the BeagleBoard. The maximum clock frequency of these signals is 65MHz.

8.13.2 OMAP3530 LCD Power

In order for the DSS outputs to operate correctly out of the OMAP3530, two voltage rails must be active, VIO_1V8 and VDD_PLL2. Both of these rails are controlled by the TPS65950 and must be set to 1.8V. By default, VDD_PLL2 is not turned and must be activated by SW. Otherwise some of the bits will not have power supplied to them.
8.13.3 TFP410 Framer

The TFP410 provides a universal interface to allow a glue-less connection to provide the DVI-D digital interface to drive external LCD panels. The adjustable 1.1-V to 1.8-V digital interface provides a low-EMI, high-speed bus that connects seamlessly with the 1.8V and 24-bit interface output by the OMAP3530. The DVI interface on the BeagleBoard supports flat panel display resolutions up to XGA at 65 MHz in 24-bit true color pixel format.

Table 15 is a description of all of the interface and control pins on the TFP410 and how they are used on BeagleBoard.

</tbody>
</table>

8.13.4 TFP410 Power

Power to the TFP410 is supplied from the 3.3V regulator in U1, the TPS2141. In order to insure a noise free signal, there are three inductors, L4, L5, and L6 that are used to filter the 3.3V rail into the TFP410.
8.13.5 TFP410 Control Pins

There are twelve control pins that set up the TFP410 to operate with the OMAP3530. Most of these pins are set by HW and do not require any intervention by the OMAP3530 to set them.

8.13.5.1 ISEL

The ISEL pin is pulled LO via R99 to place the TFP410 in the control pin mode with the I2C feature disabled. This allows the other modes for the TFP410 to be set by the other control pins.

8.13.5.2 BSEL

The BSEL pin is pulled HI to select the 24 bit mode for the Pixel Data interface from the OMAP3530.

8.13.5.3 DSEL

The DSEL pin is pulled low to select the single ended clock mode from the OMAP3530.

8.13.5.4 EDGE

The EDGE signal is pulled HI through R82 to select the rising edge on the IDCK+ lead which is the pixel clock from the OMAP3530.

8.13.5.5 DKEN

The DKEN signal is pulled HI to enable the de-skew pins. The de-skew pins, DK1-DK3, are pulled low by the internal pulldown resistors in the TFP410. This is the default mode of operation. If desired, the resistors can be installed to pull the signals high. However, it is not expected that any of the resistors will need to be installed. The DK1-DK3 pins adjust the timing of the clock as it relates to the data signals.

8.13.5.6 MSEN

The MSEN signal, when low, indicates that there is a powered monitor plugged into the DVI-D connector. This signal is not connected to the OMAP3530 and is provided as a test point only.

8.13.5.7 VREF

The VREF signal sets the voltage level of the DATA, VSYNC, HSYNC, DE, and IDCK+ leads from the OMAP3530. As the OMAP3530 is 1.8V, the level is set to .9V by R64 and R65.
8.13.5.8 PD

The PD signal originates from the OMAP3530 on the GPIO_170 pin. Because the PD signal on the TFP410 is 3.3V referenced, this signal must be converted to 3.3V. This is done by U4, SN74LVC2G07, a non-inverting open drain buffer. If the GPIO_170 pin is HI, then the open drain signal is inactive, causing the signal to be pulled HI by R98. When GPIO_170 is taken low, the output of U4 will also go LO, placing the TFP410 in the power down mode. Even though U4 is running at 1.8V to match the OMAP3530, the output will support being pulled up to 3.3V. On power up, the TFP410 is disabled by R109, a 10K resistor. When the OMAP3530 powers on, pin J25 comes in a safe mode, meaning it is not being driven. R109 insures that the signal is pulled LO, putting the TFP410 in the power down mode.

8.13.5.9 TFADJ

The TFADJ signal controls the amplitude of the DVI output voltage swing, determined by the value of R95.

8.13.5.10 RSVD2

This unused pin is terminated to ground as directed by the TFP410 data manual.

8.13.5.11 NC

This unused pin is pulled HI as directed by the TFP410 data manual.

8.13.6 DVI-D Connector

In order to minimize board size, a HDMI connector was selected for the DVI-D connection. The BeagleBoard does not support HDMI but only the DVI-D component of HDMI. The Cable is not supplied with the BeagleBoard but is available from numerous cable suppliers and is required to connect a display to the BeagleBoard.

8.13.6.1 Shield Wire

Each signal has a shield wire that is used in the cable to provide signal protection for each differential pair. This signal is tied directly to ground.

8.13.6.2 DAT0+/DAT0-

The differential signal pair DAT0+/DAT0- transmits the 8-bit blue pixel data during active video and HSYNC and VSYNC during the blanking interval.
8.13.6.3  DAT1+/DAT1-

The differential signal pair *DAT1+/DAT1-* transmits the 8-bit green pixel data during active video.

8.13.6.4  DAT2+/DAT2-

The differential signal pair *DAT2+/DAT2-* transmits the 8-bit red pixel data during active.

8.13.6.5  TXC+/TXC-

The differential signal pair *TXC+/TXC-* transmits the differential clock from the TFP410.

8.13.6.6  DDC Channel

The **Display Data Channel** or **DDC** (sometimes referred to as EDID Enhanced Display ID) is a digital connection between a computer display and the **OMAP3530** that allows the display specifications to be read by the OMAP3530. The standard was created by the Video Electronics Standards Association (VESA). The current version of DDC, called DDC2B, is based on the I²C bus. The monitor contains a read-only memory (ROM) chip programmed by the manufacturer with information about the graphics modes that the monitor can display. This interface in the LCD panel is powered by the +5V pin on the connector through *RT1*, a resetable fuse. As the OMAP3530 is 1.8V I/O, the I2C bus is level translated by *U11*, a **TXS0102**. It provides for a split rail to allow the signals to communicate. Inside of **TXS0102** is a pullup on each signal, removing the need for an external resistor.

8.13.6.7  HDMI Support

The digital portion of the DVI-D interface is compatible with HDMI and is electrically the same. A standard HDMI cable may be used to connect to the HDMI input of monitors or televisions. Whether or not the Beagle will support those monitors is dependent on the timings that are used on the Beagle and those that are accepted by the monitor. This may require a change in the software running on the Beagle. The audio and encryption features of HDMI are not supported by the Beagle.

8.13.6.8  DVI to VGA

The analog portion of DVI which provides RGB analog signals is **not supported** by the Beagle. Buying a DVI to VGA adapter connector will not work on a VGA display. You will need an active DVI-D to VGA adapter. Another option for these signals is to find a board that connects to the J4 and J5 expansion connectors and generates the RGB signals for the VGA display.
8.14 LCD Expansion Headers (Rev C2 only)

Access is provided on the Rev C2 to allow access to the LCD signals. Table 16 shows the signals that are on the J4 connector. You will notice that the signals are not in a logical order or grouping. This is due to the routing on the PCB where we allowed the routing to take president to get it to rout with no addition of layers to the design.

The current available on the DC_5V rail is limited to the available current that remains from the DC supply that is connected to the DC power jack on the board. Keep in mind that some of that power is needed by the USB Host power rail and if more power is needed for the expansion board, the main DC power supply current capability may need to be increased. All signals are 1.8V except the DVI_PUP which is a 3.3V signal.

Table 17 shows the signals that are on connector J5.

</tbody>
</table>

The 1.8V rail is for level translation only and should not be used to power circuitry on the board. The 3.3V rail also has limited capacity on the power as well. If the TFP410 is disabled on the Beagle, then 80mA is freed up for use on an adapter card connected to the LCD signals connectors. It is not required that the TFP410 be disabled when running an adapter card, but the power should be taken into consideration when making this decision.

It is suggested that the 5V rail be used to generate the required voltages for an adapter card.

#### 8.15 S-Video

A single S-Video port is provided on the BeagleBoard. **Figure 41** is the design of the S-Video interface.
Table 18 is the list of the signals on the S-Video interface and their definitions.

Power to the internal DAC is supplied by the TPS65950 via the VDAC_1V8 rail. Figure 37 reflects the filtering that is used on these rails, including the input VBAT rail.

On Rev C3 a 47pf CAP and 3.3uh inductor have been added across the feedback resistors. This was added to improve the quality of the S-Video signal.
8.16 RS232 Port

A single RS232 port is provided on the BeagleBoard. It provides access to the TX and RX lines of UART3 on the OMAP3530. Figure 42 shows the design of the RS232 port.

Figure 42. RS232 Interface Design

Figure 38 reflects the new package, DCU that was incorporated in the layout for Rev B6. Refer to Rev B5 for the Rev B5 and older that do not use the new package.

8.16.1 OMAP3530 Interface

Two lines, UART3_Tx and UART3_Rx, are provided by the OMAP3530. The UART3 function contains a programmable baud generator and a set of fixed dividers that divide the 48-MHz clock input down to the expected baud rate and also supports auto bauding.

8.16.2 OMAP3530 Level Translator

All of the I/O levels from the OMAP3530 are 1.8V while the transceiver used runs at 3.3V. This requires that the voltage levels be translated. This is accomplished by the TXS0102 which is a two-bit noninverting translator that uses two separate configurable power-supply rails. The A port tracks VCCA, 1.8V and the B port tracks VCCB, 3.3V. This allows for low-voltage bidirectional translation between the two voltage nodes. When the output-enable (OE) input is low, all outputs are placed in the high-impedance state. In this design, the OE is tied high via a 10K ohm resistor to insure that it is always on.

8.16.3 RS232 Transceiver

The RS232 transceiver used is the SN65C3221. The SN65C3221 consist of one line driver, one line receiver, and a dual charge-pump circuit with ±15-kV IEC ESD
protection pin to pin (serial-port connection pins, including GND). These devices provide the electrical interface between an asynchronous communication controller and the serial-port connector. The charge pump and four small external capacitors allow operation from a single 3-V to 5.5-V supply. The **SN65C3221** operates at data signaling rates up to 1 Mbit/s and a driver output slew rate of 24 V/ms to 150 V/ms. While the **OMAP3530** can easily drive a 1Mbit/S rate, your results may vary based on cabling, distance, and the loads and drive capability on the other end of the RS232 port.

The transceiver is powered from the 3.3V rail and is active at power up. This allows the port to be used for UART based peripheral booting over the port.

### 8.16.4 Connector

Access to the RS232 port is through a 10pin header, **P9**. Connection to the header is through a 10 pin IDC to 9 pin D-sub cable. This header requires the use of an ATI-Everex type cable. This is the only cable that will work. This cable is readily available from a number of sources and is commonly found on many PC motherboards and is not supplied with the BeagleBoard. **Figure 43** is a picture of what the cable assembly looks like.

![RS232 Cable](image.png)

**Figure 43.** RS232 Cable

When purchasing, make sure the ATI-Everex or pass through cable is ordered.

### 8.17 Indicators

There are four green indicators on the BeagleBoard:

- Power
- PMU_STAT
Three of these are programmable under SW control and the fourth one is tied to the main power rail. Figure 44 shows the connection of all of these indicators.

![Figure 44. Indicator Design](image)

### 8.17.1 Power Indicator

This indicator, D7, connects across the VBAT supply and ground. It indicates that the entire power path is supplying the power to the board. The VBAT regulator can be driven from either the USB Client port or an external 5VDC power supply. Indicator D7 does not indicate where one or the other is being used to supply the main power to the board.

### 8.17.2 PMU Status Indicator

This output is driven from the TPS65950 using the LED.B output. The TPS65950 provides LED driver circuitry to power two LED circuits that can provide user indicators. The first circuit can provide up to 160 mA and the second, 50 mA. Each LED circuit is independently controllable for basic power (on/off) control and illumination level (using PWM). The second driver, LED.B, is used to drive an LED that is connected to the VBAT rail through a resistor.

The PWM inside the TPS65950 can be used to alter the brightness of the LED if desired or it can be turned on or off by the OMAP3530 using the I2C bus. The PWM is programmable, register-controlled, duty cycle based on a nominal 4-Hz cycle which is...
derived from an internal 32-kHz clock. It is possible to set the LED to flash automatically without SW control if desired.

8.17.3 User Indicators

There are two user LEDs that can be driven directly from a GPIO pin on the OMAP3530. These can be used for any purpose by the SW. The output level of the OMAP3530 is 1.8V and the current sink capability is not enough to drive an LED with any level of brightness. A transistor pair, RN1907 is used to drive the LEDs from the VBAT rail. A logic level of 1 will turn the LED on.

In the REV A version, the LEDs were shorted, not allowing them to be controlled separately. That has been fixed on the REV B version.

8.18 JTAG

A JTAG header is provided to allow for advanced debugging on the BeagleBoard by using a JTAG based debugger. Figure 45 shows the interconnection to the OMAP3530 processor.

Figure 45. JTAG Interface

On the REV A version, a jumper was provided to allow the EMU0 line to be grounded. The version of the OMAP3 processor used on the REV B does not have this requirement. For this reason, the jumper was removed.
8.18.1 OMAP3530 Interface

The JTAG interface connects directly to the OMAP processor. All signals are a 1.8V level. **Table 19** describes the signals on the JTAG connector.

<table>

</tbody>
</table>

8.18.2 Connector

The JTAG interface uses a 14 pin connector. All JTAG emulator modules should be able to support this interface. Contact your emulator supplier for further information or if an adapter is needed.

8.19 Expansion Header

The expansion header is provided to allow a limited number of functions to be added to the board via the addition of a daughtercard.

**Figure 46** is the design of the expansion connector and the interfaces to the OMAP3530.
NOTE: The Expansion header itself is NOT provided on the BeagleBoard. This is user installed option. This header is not populated on the BeagleBoard so that based on the usage scenario; it can be populated as needed (Top, Bottom, Top right angle, or Bottom Right angle). The user should take care in installing this header.

**CAUTION:** The voltage levels on the expansion header are 1.8V. Exposure of these signals to a higher voltage will result in damage to the board and a voiding of the warranty.

8.19.1 OMAP3530 Interface

The main purpose of the expansion connector is to route additional signals from the **OMAP3530** processor. **Table 20** shows all of the signals that are on the expansion header. As the **OMAP3530** has a multiplexing feature, multiple signals can be connected to certain pins to add additional options as it pertains to the signal available. The different columns in **Table 20** show what other signals can be accessed by setting the mux control register in the **OMAP3530**.

There are a few differences on these signals on the Rev C2 vs. the other revisions. For the Rev C2, the signals in shaded areas replace the signals on the line above it. You will notice that no functionality is lost, but additional feature are gained. In addition to the new functionality, the pin muxing address and settings will need to be changed. Refer to the OMAP3530 Technical Reference Manual for more information on how to do this.

8.19.2 Expansion Signals

This section provides more detail on each of the signals available on the expansion connector. They are grouped by functions in Table 21 along with a description of each signal.

If you use these signals in their respective groups and that is the only function you use, all of the signals are available. Whether or not the signals you need are all available, depends on the muxing function on a per-pin basis. Only one signal per pin is available at any one time.

8.19.3 Power

The expansion connector provides two power rails. The first is the VIO_1.8V rail which is supplied by the TPS65950. This rail is limited in the current it can supply from the TPS65950 and what remains from the current consumed by the BeagleBoard and is intended to be used to provide a rail for voltage level conversion only. It is not intended to power a lot of circuitry on the expansion board. All signals from the BeagleBoard are at 1.8V.

The other rail is the DC_5V. The same restriction exits on this rail as mentioned in the USB section. The amount of available power to an expansion board depends on the available power from the DC supply or the USB supply from the PC.

8.19.4 Reset

The nRESET signal is the main board reset signal. When the board powers up, this signal will act as an input to reset circuitry on the expansion board. After power up, a system reset can be generated by the expansion board by taking this signal low. This signal is a 1.8V level signal.

8.19.5 Power Control

There is an additional open-drain signal on the connector called REGEN. The purpose of this signal is to provide a means to control power circuitry on the expansion card to turn on and off the voltages. This insures that the power on the board is turned on at the appropriate time. Depending on what circuitry is provided on the expansion card, an additional delay may be needed to be added before the circuitry is activated. Refer to the OMAP3530 and TPS65950 documentation for more information.

8.20 Additional Expansion Header

If you choose not to use the LCD headers for access to the LCD signals or for the DVI-D interface, they can also be used for other functions on the board based on the multiplexer setting of each pin. Table 22 shows the options for J4 and Table 23 shows the options for...
J5. The MUX: column indicates which MUX mode must be set for each pin to make the respective signals accessible on the pins of the OMAP3530.

9.0 Connector Pinouts and Cables

This section provides a definition of the pinouts and cables to be used with all of the connectors and headers on the BeagleBoard.

**THERE ARE NO CABLES SUPPLIED WITH THE BEAGLEBOARD.**

9.1 Power Connector

*Figure 47* is a picture of the BeagleBoard power connector with the pins identified. The supply must have a 2.1mm center hot connector with a 5.5mm outside diameter.

![Power Connector Diagram](image)

*Figure 47. Power Connector*

The supply must be at least 500mA with a maximum of 2A. If the expansion connector is used, more power will be required depending on the load of the devices connected to the expansion connector.

**WARNING: DO NOT PLUG IN ANYTHING BUT 5V TO THE DC CONNECTOR OR THE BOARD WILL BE DAMAGED!!!!**
9.2 USB OTG

Figure 48 is a picture of the BeagleBoard USB OTG connector with the pins identified.

![DVI-D Cable](image)
9.5 LCD (REV C2)

This section covers the pair of headers that provide access to the raw 1.8V DSS signals from the OMAP3530 processor. This provides the ability to create adapters for such things as different LCD panels, LVDS, etc.

9.5.1 Connector Pinout

The Table 25 and 26 define the pinout of the LCD connectors. This feature is only on the Rev C2 board and is not populated with a connector. All signal levels are 1.8V with the exception of DVI_PUP signal which is 3.3V.

9.5.2 Connector Suppliers

The actual connector to be used will be determined by the supplier of the board to be plugged into the Beagle. Table 27 below list a few of the part numbers and suppliers that can be used for the connectors on the LCD interface. All of the listed connectors are in a vertical mount configuration.

<table>
<thead>
<tr>
<th>Supplier</th>

<td>4.83</td>
</tr>
</tbody>
</table>
9.5.4 Mounting Scenarios

This section provides a few possible mounting scenarios for the LCD connectors. It should be noted that the voltage level of these signals are 1.8V. It will require that they be buffered in order to drive other voltage levels.

9.5.4.1 Top Mounting

Figure 54 shows the board being mounted on top of the BeagleBoard.
9.5.4.2  **Bottom Mounting**

Figure 55 shows the board being mounted under the BeagleBoard.
9.6 Audio Connections

Figure 56 is the audio input jack required to connect to the BeagleBoard.

Figure 56. Audio In Plug

Figure 57 is the actual connector used on the BeagleBoard.

Figure 57. Audio In Plug
9.7 Audio Out

Figure 58 is the audio out jack required to connect to the BeagleBoard.

![Figure 58. Audio Out Plug](image)

Figure 59 is the actual connector used on the BeagleBoard.

![Figure 59. Audio In Plug](image)
9.8 JTAG

Figure 60 is the JTAG connector pin out showing the pin numbering.

![Figure 60. JTAG Connector Pinout](image)

Table 29 gives a definition of each of the signals on the JTAG header.

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
<th>Description</th>
<th>I/O</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>JTAG TMS</td>
<td>Test mode select</td>
<td>I/O</td>
</tr>
<tr>
<td>3</td>
<td>JTAG TDI</td>
<td>Test data input</td>
<td>I</td>
</tr>
<tr>
<td>7</td>
<td>JTAG TDO</td>
<td>Test Data Output</td>
<td>O</td>
</tr>
<tr>
<td>9</td>
<td>JTAG RTCK</td>
<td>ARM Clock Emulation</td>
<td>O</td>
</tr>
<tr>
<td>11</td>
<td>JTAG TCK</td>
<td>Test Clock</td>
<td>I</td>
</tr>
<tr>
<td>2</td>
<td>JTAG nTRST</td>
<td>Test reset</td>
<td>I</td>
</tr>
<tr>
<td>13</td>
<td>JTAG EMU0</td>
<td>Test emulation 0</td>
<td>I/O</td>
</tr>
<tr>
<td>14</td>
<td>JTAG EMU1</td>
<td>Test emulation 1</td>
<td>I/O</td>
</tr>
<tr>
<td>5</td>
<td>VIO</td>
<td>Voltage pin</td>
<td>PWR</td>
</tr>
<tr>
<td>4,8,10,12,14</td>
<td>GND</td>
<td>Ground</td>
<td>PWR</td>
</tr>
</tbody>
</table>

All of the signals are 1.8V only. The JTAG emulator must support 1.8V signals for use on the BeagleBoard.
If a 20 pin connector is provided on the JTAG emulator, then a 20 pin to 14 pin adapter must be used. You may also use emulators that are either equipped with a 14 pin connector or are universal in nature.

Figure 61 shows an example of a 14 pin to 20 pin adapter.

Figure 62 shows how the JTAG cable is to be routed when connected to the BeagleBoard.
9.9 RS232

Figure 63 is the RS232 header on the BeagleBoard with the pin numbers identified.

![RS232 Header Image]

Figure 63. RS232 Header

Figure 64 is the cable that is required in order to access the RS232 header. This cable can be purchased from various sources and is referred to as the ATI/Everex type cable.

9.11 Battery Installation

9.11.1 Battery

The board was designed to use the VL-1220/VCN battery from Panasonic-BSG. This is a Vanadium Pentoxide Lithium Rechargeable Battery with a 7mAH capacity. Figure 66 is a picture of the battery.

Figure 66. Optional Battery

9.11.2 Battery Installation

THE FOLLOWING STRUCTIONS ASSUME THE USER HAS PREVIOUS EXPERIENCE WITH BATTERIES. BATTERY INSTALLATION IS THE SOLE RESPONSABILTY OF THE USER. INSTALLATION OF THE BATTERY BY THE USER IS AT THEIR OWN RISK. FAILURE TO FOLLOW THE INSTRUCTIONS CAN RESULT IN DAMAGE TO THE BOARD. THIS DAMAGE IS NOT COVERED UNDER THE WARRANTY.
**Figure 67** shows the location of the battery on the Beagle Board.

Following are the steps required to install the battery.

1) Remove all cables from the board.
2) Remove R66 from the board as shown on **Figure 67**.
3) Using Figure 66, locate the positive (+) lead of the battery.
4) Insert the (+) lead into the hole that is marked (+) on **Figure 67**.
10.0 BeagleBoard Accessories

Throughout this manual various items are mentioned as not being provided with the standard BeagleBoard package or as options to extend the features of the BeagleBoard. The concept behind BeagleBoard is that different features and functions can be added to BeagleBoard by bringing your own peripherals. This has several key advantages:

- User can choose which peripherals to add.
- User can choose the brand of peripherals based on driver availability and ability to acquire the particular peripheral
- User can add these peripherals at a lower cost than if they were integrated into the BeagleBoard.

This section covers these accessories and add-ons and provides information on where they may be obtained. Obviously things can change very quickly as it relates to devices that may be available. Please check BeagleBoard.org for an up to date listing of these peripherals.

Inclusion of any products in this section does not guarantee that they will operate with all SW releases. It is up to the user to find the appropriate drivers for each of these products. Information provided here is intended to expose the capabilities of what can be done with the BeagleBoard and how it can be expanded.

All pricing information provided is subject to change and in most cases is likely to be lower depending on the products purchased and from where they are purchased.

Covered in this section are the following accessories:

- DC Power Supplies
- Serial Ribbon cable
- USB Hubs
- USB Thumb Drives
- DVI-D Cables
- DVI-D Monitors
- SD/MMC Cards
- USB to Ethernet
- USB to WiFi
- USB Bluetooth
- Expansion Cards

**NO CABLES OR POWER SUPPLIES ARE PROVIDED WITH THE BEAGLEBOARD.**
10.1 DC Power Supply

Tabletop or wall plug supplies can be used to power BeagleBoard. Table 31 provides the
specifications for the BeagleBoard DC supply. Supplies that provide additional current
than what is specified can be used if additional current is needed for add on accessories.
The amount specified is equal to that supplied by a USB port.

Table 31. DC Power Supply Specifications

<table>
<thead>
<tr>
<th>Specification</th>
<th>Requirement</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>

<td>Current</td>
<td>500mA (minimum)</td>
<td>mA</td>
</tr>
<tr>
<td>Connector</td>
<td>2.1mm x 5.5mm Center hot</td>
<td></td>
</tr>
</tbody>
</table>

It is recommended that a supply higher than 500mA be used if higher current peripherals
are expected to be used or if expansion boards are added.

Table 32 lists some power supplies that will work with the BeagleBoard.

</tbody>
</table>

10.3 USB Hubs

There are no known or anticipated issues with USB hubs. However, it should be noted that a self powered hub is highly recommended. Table 34 is a list of Hubs that have been tested on the BeagleBoard.

Table 34. USB Hubs Tested

<table>
<thead>
<tr>
<th>Supplier</th>

</tr>
</thead>
<tbody>
<tr>
<td>IOGEAR</td>
<td>GUH274</td>
</tr>
<tr>
<td>D-Link</td>
<td>DUB-H4 2.0</td>
</tr>
<tr>
<td>Vakoss</td>
<td>TC-204-NS</td>
</tr>
</tbody>
</table>
10.4 DVI Cables

In order to connect the DVI-D interface to a LCD monitor, a HDMI to DVI-D cable is required. Figure 71 is a picture of a HDMI to DVI-D cable.

![HDMI to DVI-D Cable](image)

Figure 71. HDMI to DVI-D Cable

10.5 DVI-D Monitors

There are many monitors that can be used with the BeagleBoard. With the integrated EDID feature, timing data is collected from the monitor to enable the SW to adjust its timings. Table 35 shows a short list of the monitors that have been tested to date on the BeagleBoard at the 1024x768 resolution. Please check on BeagleBoard.org for an up to date listing of the DVI-D monitors as well as information on the availability of drivers.

<table>
<thead>
<tr>
<th>Manufacturer</th>
<th>Part Number</th>

</tr>
<tr>
<td>Insignia</td>
<td>NS-LCD15</td>
<td>Tested</td>
</tr>
<tr>
<td>Dell</td>
<td>1708FP</td>
<td>Tested</td>
</tr>
</tbody>
</table>

The digital portion of the DVI-D interface is compatible with HDMI and is electrically the same. A standard HDMI cable may be used to connect to the HDMI input of monitors. Whether or not the Beagle will support those monitors is dependent on the timings that are used on the Beagle and those that are accepted by the monitor. This may require a change in the software running on the Beagle. The audio and encryption features of HDMI are not supported by the Beagle.

The analog portion of DVI which provides RGB analog type signals is not supported by the Beagle. Buying a DVI to VGA adapter connector will not work on a VGA display. You will need an active DVI-D to VGA adapter.

[beagleboard.org](http://beagleboard.org)
10.6 SD/MMC Cards

Table 36 is a list of SD/MMC cards that have been tested on BeagleBoard. Please check BeagleBoard.org for an up to date listing of the SD/MMC cards that have been tested as well as information on the availability of drivers if required.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Microcenter</td>
<td>SD</td>
<td>1GB/2GB</td>
<td>Tested</td>
</tr>
</tbody>
</table>

10.7 USB to Ethernet

There are several USB to Ethernet adapters on the market and Figure 72 shows a few of these devices. These devices can easily add Ethernet connectivity to BeagleBoard by using the USB OTG port in the host. This will require a special cable to convert the miniAB connector to a Type A or a hub can also be used. These are provided as examples only. Check BeagleBoard.org for information on devices that have drivers available for them.

![USB to Ethernet Adapters](image)

Table 37 provides examples of USB to Ethernet Adapters that might be used with the BeagleBoard. This list has not been verified. Inclusion of these items in the table does not guarantee that they will work, but is provided as examples only. Please check BeagleBoard.org for an up to date listing of the USB to Ethernet devices as well as information on the availability of drivers.

MOSCHIP is the silicon provider for USB to Ethernet devices. The product that has been tested uses the 7830 from MOSCHIP and has a vendor ID of 9710 and a product ID of 7830. The devices above that are based upon the MOSCHIP device are highlighted in red.

10.8 USB to WiFi

There are several USB to WiFi adapters on the market and Figure 73 shows a few of these devices. These devices can easily add WiFi connectivity to BeagleBoard by using the USB OTG port in the host mode. This will require a special cable to convert the miniAB connector to a Type A or a hub can also be used. These are provided as examples only. Check BeagleBoard.org for information on devices that have drivers available for them.

Table 38 provides a list of USB to WiFi adapters that could be used with the BeagleBoard. Inclusion of these items in the table does not guarantee that they will work, but is provided as examples only. Please check BeagleBoard.org for an up to date listing of the USB to WiFi devices as well as information on the availability of drivers.

It should be noted that the availability of Linux drivers for various WiFi devices is limited. Before purchasing a particular device, please verify the availability of drivers for that device.
10.9 USB to Bluetooth

There are several USB to Bluetooth adapters on the market and Figure 74 shows a few of these devices. These devices can easily add Bluetooth connectivity to BeagleBoard by using the USB OTG port in the host mode. This will require a special cable to convert the miniAB connector to a Type A or a hub can also be used. These are provided as examples only. Check BeagleBoard.org for information on devices that have drivers available for them and their test status.

![USB to Bluetooth Adapters](image)

Table 39 provides a list of USB to Bluetooth adapters that could be used with the BeagleBoard. Inclusion of these items in the table does not guarantee that they will work, but is provided as examples only. Please check BeagleBoard.org for an up to date listing of the USB to Bluetooth devices as well as information on the availability of drivers.

10.10 Expansion Cards

This section is reserved for future use as expansion cards are released for the BeagleBoard by various sources.

11.0 Mechanical Information

11.1 BeagleBoard Dimensions

This section provides information on the mechanical aspect of the BeagleBoard. Figure 75 is the dimensions of the BeagleBoard.

![Figure 75. BeagleBoard Dimension Drawing](image-url)
11.2 BeagleBoard Daughter Card Information

This section provides information on what is required from a mechanical aspect to create a daughter card for the BeagleBoard. Users are free to create their own cards for private or commercial use. The concept of a standard card size for these cards is not being set down. The examples provided in this section show what is possible and is provided as a starting point. The idea is not to limit the possibilities.

11.2.1 Stacked Daughtercard Card

One method is to provide a daughtercard stacked onto the board. This can be either mounted on top of the BeagleBoard or under the BeagleBoard. Figure 76 and Figure 77 shows these two strategies.

![Figure 76. BeagleBoard Top Stacked Daughtercard Card](image1)

![Figure 77. BeagleBoard Bottom Stacked Daughtercard Card](image2)
11.2.2 Offset Daughter Card Information

Another option is to create a daughtercard that plugs in from the side. Figure 78 and Figure 79 shows the offset daughtercard using a board to board connector system.

![Figure 78. BeagleBoard Offset Daughter Card Side](image)

![Figure 79. BeagleBoard Offset Daughter Card Top](image)

11.2.3 Ribbon Cable Daughter Card Information

Another method is to use a ribbon cable to connect the two boards together. Figure 80 shows this concept.

![Figure 80. Ribbon Cable Daughter Card](image)
11.3 BeagleBoard LCD Adapter Card Information

It is expected that LCD Adapter cards will be made to allow for the connection of various LCD or display interfaces onto the LCD connectors. As these materialize, the information will be added in this section.

12.0 Board Verification

This section provides a step by step process to be followed to verify that the hardware is working. This is the same basic process the board is taken through in production testing.

For an up to date listing of common questions and their answers, please refer to http://elinux.org/BeagleBoardFAQ

12.1 Equipment

To run these tests you will need the following components:

- BeagleBoard
- 5V DC supply with a 2.1mm I.D. and 5.5mm O.D. connector
- SD Card
- PC
- USB miniA to A cable
- USB HUB
- DVI-D Monitor
- DVI-D to HDMI cable
- Speakers
- 3.5mm stereo cable with connectors on both ends
- DB9 Null-Modem Cable
- DB9 to IDC-10 cable ATI/Everex configuration
12.2  Out of the Box

Each BeagleBoard comes pre-loaded with the XLoader and UBoot in Flash. When powered up, it will do the following:

1. Plug in either a USB cable to the board and then to a PC or plug in a 5V power supply.
2. Power LED (D5) will turn on.
3. On the terminal window the following will be printed:

   Texas Instruments X-Loader 1.4.2 (Feb 19 2009 - 12:01:24)  
   Loading u-boot.bin from nand

   U-Boot 2009.01-dirty (Feb 19 2009 - 12:22:31)

   I2C:   ready
   OMAP3530-GP rev 2, CPU-OPP2 L3-165MHz
   OMAP3 Beagle board + LPDDR/NAND
   DRAM:  256 MB
   NAND:  256 MiB
   *** Warning - bad CRC or NAND, using default environment
   MUSB: using high speed
   In:    serial usbtty
   Out:   serial usbtty
   Err:   serial usbtty

   The warning message is not an indication of an error condition and is normal. The UBoot is configured to look for a script file on the SD card for booting instructions. If not found, it will then look for the environment variables. As these are not loaded at the factory, you will see the warning message.

4. At this point the following LEDS will turn on:
   - USR0
   - USR1
   - PMU

5. Then the following will be sent to the terminal window and a countdown will commence. To stop the countdown, hit any key on the terminal

   Board revision C
   Serial #4860000300000000004013f8a17019010
   Hit any key to stop autoboot: 10

   The revision of the board should be identified as a Rev C. The Serial# is NOT the board serial number, but a unique ID for the processor.
6. The BeagleBoard.org logo will be sent out of the DVI port and the color bars will appear on the S-Video Port.

7. If you do not stop the booting process by hitting a key, the following will be printed to the terminal.

   No MMC card found
   Booting from nand ...

   NAND read: device 0 offset 0x280000, size 0x400000
   4194304 bytes read: OK
   Wrong Image Format for bootm command
   ERROR: can't get kernel image!
   OMAP3 beagleboard.org #

12.3 SD Card Configuration

In order to boot from the SD card, it must be formatted and the files loaded. The following steps explain that process.

1. Format the MMC/SD Card for FAT32 File System using the HP USB Disk Storage Format Tool 2.0.6: http://selfdestruct.net/misc/usbboot/SP27213.exe
2. Insert the Card writer/reader into the Windows machine.
3. Insert MMC/SD card into the card reader/writer
4. Open the HP USB Disk Storage Format Tool.
5. Select “FAT as File System”. Click on “Start”.
6. After formatting is done Click “OK”
7. Copy the following files on to MMC in the exact order listed. COPY THE MLO FIRST! Make sure you name the file as indicated in the BOLD type. These files can be found at http://code.google.com/p/beagleboard/wiki/BeagleboardRevCValidation

   MLO as MLO
   u-boot as u-boot.bin
   u-boot for flash as u-boot-f.bin
   ramdisk image as ramdisk.gz
   Kernel (ulmage) as ulmage.bin
   reset.scr as boot.scr
   x-loader image as x-load.bin.ift
   Regular script file as normal.scr
12.4 Setup

This step sets up the board for the tests to follow.

1. Make sure Beagle power is in OFF state by removing the 5V supply and the USB host connection.
2. Connect the IDC UART cable the BeagleBoard and using a Null-Modem serial cable connect it to a SERIAL port on a Window/Linux/Mac machine
3. Have terminal program, such as TeraTerm, HyperTerminal, or Minicom, running on the host machine.
4. Configure the terminal program for (BAUD RATE - 115200, DATA - 8 bit, PARITY- none, STOP - 1bit, FLOW CONTROL - none)
5. Insert the MMC/SD card (that is prepared as described above) into MMC/SD slot on Beagle Board.
6. Connect a LCD Monitor to DVI/HDMI port on the Beagle Board.
7. Connect an externally powered speaker to audio out jack on Beagle Board.
8. Connect a Line-in cable from PC or any player to Audio In jack on Beagle Board.
9. Connect a TV (NTSC-M) to S-video port.
10. Power ON LCD, TV and audio speakers.

12.5 Factory Boot Verification

The BeagleBoard comes pre-Flashed with the Xloader and UBoot in Flash. This step verifies that the board will boot properly from NAND. If the board has been flashed and the default code removed or overwritten, then you should proceed to the next step.

1. Connect the USB cable to the Host PC,
2. The power LED should come on.
3. On the terminal window the following should be printed out by the BeagleBoard:

```
Texas Instruments X-Loader 1.4.2 (Feb 19 2009 - 12:01:24)
Loading u-boot.bin from nand

U-Boot 2009.01-dirty (Feb 19 2009 - 12:22:31)
I2C: ready
OMAP3530-GP rev 2, CPU-OPP2 L3-165MHz
OMAP3 Beagle board + LPDDR/NAND
DRAM: 256 MB
NAND: 256 MiB
*** Warning - bad CRC or NAND, using default environment
MUSB: using high speed
In:  serial usbtty
```
Out:  serial usbtty
Err:  serial usbtty
Board revision C
Serial #486000030000000004013f8a17019010
Hit any key to stop autoboot: 10
No MMC card found
Booting from nand ...

NAND read: device 0 offset 0x280000, size 0x400000
4194304 bytes read: OK
Wrong Image Format for bootm command
ERROR: can't get kernel image!
OMAP3 beagleboard.org #
OMAP3 beagleboard.org#

4. The USER LEDS and the PMU LED should be on.
5. The S-Video output should display color bars.
6. The DVI-D monitor should display the BeagleBoard.org Logo.

12.6 Board SD Boot

This test will force the BeagleBoard to boot from the SD card instead of the onboard Flash.

1. Press and hold the USER button while pressing and releasing the RESET button.
2. The following should be printed to the terminal window:

   40V

   Texas Instruments X-Loader 1.4.2 (Feb 19 2009 - 12:01:24)
   Reading boot sector
   Loading u-boot.bin from mmc

   U-Boot 2009.01-dirty (Feb 19 2009 - 12:23:21)

   I2C: ready
   OMAP3530-GP rev 2, CPU-OPP2 L3-165MHz
   OMAP3 Beagle board + LPDDR/NAND
   DRAM: 256 MB
   NAND: 256 MiB
   Using default environment

   MUSB: using high speed
   In:  serial usbtty
   Out:  serial usbtty
   Err:  serial usbtty
   Board revision C
3. The USER LEDS and the PMU LED should be on.

Hitting any key on the terminal before the countdown reaches 10, will stop the booting process. If no key is hit, it will continue and flash the SW into the NAND. Go to the next section for a description of this.

### 12.7 Factory Boot Reinstall

This section tells you how to restore the information in the Flash to the factory default. This is the same test that is run in production when the board is new. The erase process is automatically run before the Flashing process starts.

Prior to getting to this section, follow the process and section 12.6 and do not hit any key on the terminal.

1. As long as no key is pressed on the terminal, the following will be displayed:

   ```
   reading boot.scr
   679 bytes read
   Running bootscript from mmc ...
   ## Executing script at 80200000
   reading x-load.bin.ift
   20392 bytes read
   ```

2. The x-load.bin.ift contains the XLoader file that will be flashed into the NAND in the following steps. The following will be displayed:

   ```
   ***** Replacing x-load *****
   Usage:
   nand - NAND sub-system

   HW ECC selected

   NAND erase: device 0 offset 0x0, size 0x80000
   Erasing at 0x0 -- 25% complete.
   Erasing at 0x20000 -- 50% complete.
   Erasing at 0x40000 -- 75% complete.
   Erasing at 0x60000 -- 100% complete.
   OK

   NAND write: device 0 offset 0x0, size 0x20000
   131072 bytes written: OK
   ```
3. The u-boot-f.bin contains the UBoot file that will be flashed into the NAND in the following steps. The following will be displayed:

```
reading u-boot-f.bin
275928 bytes read
***** Replacing u-boot *****
Usage:
nand - NAND sub-system

SW ECC selected

NAND erase: device 0 offset 0x80000, size 0x160000
Erasing at 0x80000 --  9% complete.
Erasing at 0xa0000 --  18% complete.
Erasing at 0xc0000 --  27% complete.
Erasing at 0xe0000 --  36% complete.
Erasing at 0x100000 --  45% complete.
Erasing at 0x120000 --  54% complete.
Erasing at 0x140000 --  63% complete.
Erasing at 0x160000 --  72% complete.
Erasing at 0x180000 --  81% complete.
Erasing at 0x1a0000 --  90% complete.
Erasing at 0x1c0000 -- 100% complete.
OK

NAND write: device 0 offset 0x80000, size 0x160000
1441792 bytes written: OK
```

4. After the XLoader and UBot are flashed, the environment variables are erased to insure proper booting of the Kernel image that I son the SD card. The following will be displayed:

```
***** Erasing environment settings *****
Usage:
nand - NAND sub-system

NAND erase: device 0 offset 0x160000, size 0x20000
Erasing at 0x160000 -- 100% complete.
OK
```
5. At this point you can remove power to stop the Kernel from booting, or just let it continue the Kernel boot process. For information on the Kernel booting process, proceed to the next section.

12.8 Booting the Kernel

This section describes how to boot the kernel from the SD card. In order to complete this section, you must have completed section 12.7 and do not hit any keys or remove power after the NAND has been flashed.

1. After the NAND has been flashed, the normal.scr script is read from the SD card and the first step after that is to load in the ulimage.bin file into the SDRAM. Beagle will print the following to the terminal:

   **** Executing normal.scr ****
   ## Executing script at 80200000
   reading ulimage.bin

   2578044 bytes read
   **** Kernel: /dev/mmcblk0p1/ulimage.bin *****

2. Then the root filesystem is read into SDRAM. The BeagleBoard will output the following:

   reading ramdisk.gz

   7999649 bytes read
   **** RootFS: /dev/mmcblk0p1/ramdisk.gz *****
   1856680 bytes read

3. At this point, the booting process will start. The following will be printed to the terminal:

   ## Booting kernel from Legacy Image at 80200000 ...
   Image Name:   Linux-2.6.28-omap1
   Image Type:   ARM Linux Kernel Image (uncompressed)
   Data Size:    2577980 Bytes =  2.5 MB
   Load Address: 80008000
   Entry Point:  80008000
   Verifying Checksum ... OK
   Loading Kernel Image ... OK
   OK
   Starting kernel ...
   Uncompressing
   Linux.........................................................................................................................................................
   ........... done, booting the kernel.

   Linux version 2.6.28-omap1 (root@tiioss) (gcc version 4.2.1 (CodeSourcery Sourcery G++ Lite 2007q3-51)) #2 Thu Feb 19 12:45:34 IST 2009

The Angstrom Distribution beagleboard ttyS2
Angstrom 2008.1-test-20090127 beagleboard ttyS2
beagleboard login:

4. Type root and hit <enter>. You now are in the Linux kernel.
12.9 UBoot Tests

There are a series of tests that are run while in UBoot. This requires that the Beagle is not in the Kernel mode, but the UBoot mode. The UBoot mode is entered by hitting a key prior to the UBoot timeout reaching 10.

The following sections describe each test and how it is to be run.

12.9.1 EDID Test

This test will display the EDID (Enhanced Display ID) from the DVI-D monitor by using the I2C interface on the DVI-D connector. The DVI-D connector must be connected to a DVI-D compatible monitor in order to run this test.

1. Type the following commands:

```
OMAP3 beagleboard.org # ibus 2
OMAP3 beagleboard.org# imd 0x50 0 100
```

2. Something similar to the following will be displayed:

```
0000: 00 ff ff ff ff ff 00 10 ac 24 40 5a 39 41 41 ...
0010: 1f 11 01 03 80 22 1b 78 ee a5 a6 54 4c 99 26 ...
0020: 14 50 54 a5 4b 00 71 4f 81 80 01 01 01 01 01 ...
0030: 01 01 01 01 01 01 01 01 01 01 01 01 01 01 01 ...
0040: 30 2a 00 98 51 00 2a 00 00 00 00 00 00 00 00 ...
0050: 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 ...
0060: 30 2a 00 00 00 00 00 00 00 00 00 00 00 00 00 ...
```

Note the words "DELL 1708FP" which is the ID of the monitor in this example. It will be different based on the display manufacturer of your display. For more detailed information on the full EDID format, refer to: [http://en.wikipedia.org/wiki/EDID](http://en.wikipedia.org/wiki/EDID)

12.9.2 LED Test

This test checks out the PWM and USER0/1 LEDs on the Beagle.

1. Type the following commands followed by the <ENTER> key and verify that the correct results are seen on LEDs USR0 and USR1.

```
OMAP3 beagleboard.org # mw 0x49056090 0x00600000 [USR0 & USR1 OFF]
OMAP3 beagleboard.org # mw 0x49056094 0x00400000 [USR0 ON]
OMAP3 beagleboard.org # mw 0x49056090 0x00020000 [USR1 ON]
```

2. Type the following commands and verify that the correct results are seen on PMU LED.
12.9.3 DVI-D Test

This test checks the DVI-D interface for proper operation. It sends various colors to the DVI-D monitor.

1. Type the following commands followed by the <ENTER> key and verify the correct results are seen.

   OMAP3 beagleboard.org # mw 0x49058090 0x00000400 [DISPLAY TURNS OFF]
   OMAP3 beagleboard.org # mw 0x49058094 0x00000400 [DISPLAY TURNS ON]
   OMAP3 beagleboard.org # mw 0x80500000 07e007e0 7fff [DISPLAY TURNS GREEN]
   OMAP3 beagleboard.org # mw 0x80500000 001f001f 7fff [DISPLAY TURNS BLUE]
   OMAP3 beagleboard.org # mw 0x80500000 00000000 7fff [DISPLAY TURNS BLACK]
   OMAP3 beagleboard.org # mw 0x80500000 fffffff 7fff [DISPLAY TURNS WHITEN]
   OMAP3 beagleboard.org # mw 0x80500000 f800f800 7fff [DISPLAY TURNS RED]

12.10 Kernel Based Tests

The following tests require that the Kernel is loaded and that you have logged into the Kernel. [See section 12.8]

12.10.1 DVI-D Test

This test plays a short video clip to the DVI-D monitor.

1. Type the following command:

   root@beagleboard:~# mplayer /sample_video.avi

2. It will display a 320x240 video on the DVI screen. The video has been downloaded from https://garage.maemo.org/download.php/54/269/2380/bug.avi

12.10.2 S-Video Test

1. Type the following command:

   root@beagleboard:/mmc# svideo
2. Type the following command to start the video:

```
[root@beagleboard:/mmc# mplayer /sample_video.avi
```

3. It will display a 320x240 video on the DVI screen. The video has been downloaded from [https://garage.maemo.org/download.php/54/269/2380/bug.avi](https://garage.maemo.org/download.php/54/269/2380/bug.avi)

### 12.10.3 Audio Test

The audio test is divided into two tests, one for audio in and one for audio out. Audio is recorded into the audio in port and then played out the audio out port.

#### 12.10.3.1 Audio In

1. Make sure your player is running and Audio Line in is connected to the board.
2. Make sure that you are in the MMC directory. If you are, proceed to step 4. If not, then type the following command:

```
root@beagleboard:~# mount -t vfat /dev/mmcblk0p1 /mnt
```

3. Change the directory by typing:

```
root@beagleboard:/mmc# cd /mmc
```

4. Type the following command:

```
root@beagleboard:/mmc# arecord -t wav -c 2 -r 44100 -f S16_LE -v /mmc/k
```

5. The following output is expected on the terminal window:

```
Recording WAVE '/mmc/k' : Signed 16 bit Little Endian, Rate 44100 Hz, Stereo
Plug PCM: Hardware PCM card 0 'omap3beagle' device 0 subdevice 0
Its setup is:
  stream       : CAPTURE
  access       : RW_INTERLEAVED
  format       : S16_LE
  subformat    : STD
  channels     : 2
  rate         : 44100
  exact rate   : 44100 (44100/1)
  msbits       : 16
  buffer_size  : 22052
  period_size  : 5513
  period_time  : 125011
  tstamp_mode  : NONE
  period_step  : 1
  avail_min    : 5513
  period_event : 0
```
6. When you want to stop the recording process just press `<CONTROL+C>`.

### 12.10.3.2 Audio Out

**NOTE:** It is expected that you have previously recorded an audio file to be played and that you are still in the MMC directory.

1. Type the following command:

   ```
   root@beagleboard:/mmc# aplay -t wav -c 2 -r 44100 -f S16_LE -v k
   ```

2. The recorded audio should be heard on the Speakers,

3. The following output is expected on terminal window:

   ```
   Playing WAVE '/mmc/k': Signed 16 bit Little Endian, Rate 44100 Hz, Stereo
   Plug PCM: Hardware PCM card 0 'omap3beagle' device 0 subdevice 0
   Its setup is:
   stream       : PLAYBACK
   access       : RW_INTERLEAVED
   format       : S16_LE
   subformat    : STD
   channels     : 2
   rate         : 44100
   exact rate   : 44100 (44100/1)
   msbits       : 16
   buffer_size  : 22052
   period_size  : 5513
   period_time  : 125011
   tstamp_mode  : NONE
   period_step  : 1
   avail_min    : 5513
   period_event : 0
   start_threshold : 22052
   stop_threshold : 22052
   silence_threshold: 0
   silence_size : 0
   boundary     : 1445199872
   ```

7. To stop the audio playback just press `<CONTROL+C>`. If you choose, you can let the recorded audio play out. It will stop when it reaches the end of the recorded file.
### 12.10.3.3 Keyboard Test

This test runs on the OTG port in the Host mode. It requires that a Powered USB hub be used, and that the Hub and device (Keyboard or mouse) be connected when the Linux OS is booted. This section is broken down into two sections, one for the mouse and the other for the keyboard.

**NOTE: This test is run after the OS is booted with the Hub and Keyboard plugged in.**

1. Make sure that you are in the MMC directory. If you are, proceed to step 3. If not, then type the following command:

   ```bash
   root@beagleboard:~# mount -t vfat /dev/mmcblk0p1 /mnt/mmc/cd /mnt/mmc/
   ```

2. Change the directory by typing:

   ```bash
   root@beagleboard:~# cd /mmc
   ```

3. Type the following command:

   ```bash
   root@beagleboard:/mmc# evtest /dev/input/event1
   ```

4. Press a Key on USB Keyboard and look for a printout in the terminal window.

   Example if "a" is pressed the following output is seen on Console:

   ```
   Event: time 1657.754638, type 1 (Key), code 30 (A), value 1
   Event: time 1657.754638, -------------- Report Sync ------------
   Event: time 1657.964599, type 1 (Key), code 30 (A), value 0
   Event: time 1657.964599, -------------- Report Sync ------------
   ```

5. Press `<CONTROL+C>` to stop the test.

### 12.10.3.4 Mouse Test

**NOTE: This test is run after the Kernel booted with the Hub and mouse plugged in.**

1. Make sure that you are in the MMC directory. If you are, proceed to step 3. If not, then type the following command:

   ```bash
   root@beagleboard:~# mount -t vfat /dev/mmcblk0p1 /mnt/mmc/
   ```

2. Change the directory by typing:

   ```bash
   root@beagleboard:~# cd /mnt/mmc/
   ```
3. Type the following command:

   root@beagleboard:/mmc# evtest /dev/input/event0

4. Press mouse button and look for a printout in the terminal window.

   Example if Left button is pressed and released the following lines should get displayed on console

   Event: time 1871.724792, -------------- Report Sync ------------
   Event: time 1873.804687, type 1 (Key), code 272 (LeftBtn), value 1
   Event: time 1873.804687, -------------- Report Sync ------------
   Event: time 1873.964660, type 1 (Key), code 272 (LeftBtn), value 0
   Event: time 1873.964660, -------------- Report Sync ------------

5. Moving the Mouse also results in Console messages

   Event: time 1959.120635, -------------- Report Sync ------------
   Event: time 1959.130676, type 2 (Relative), code 0 (X), value -21
   Event: time 1959.130676, -------------- Report Sync ------------
   Event: time 1959.140625, type 2 (Relative), code 0 (X), value -16

6. Press <CONTROL+C> to stop the test

12.10.3.5 USB EHCI Test

The following test will copy a file from the SD card to the USB EHCI port and back. The file name can be changed to anything on the SD card. You must have a USB ThumbDrive installed in the EHCI port at power up.

Start in the root directory and make sure the MMC directory is already mounted.

1. Type the following commands to set up the test:

   root@beagleboard:~# mount /dev/sda1 /usb1
   root@beagleboard:~# mount /dev/sda1 /usb1

2. Type the following commands to copy from the SD card to the USB Drive:

   root@beagleboard:~# cp /mmc/u-boot.bin /usb1/test.bin

3. Type the following command to make sure the file was copied to the USB drive:

   root@beagleboard:~# ls -al /usb1

   The file should be listed in the directory.

4. Type the following command to copy the file from the USB drive to the SD card.

   root@beagleboard:~# cp /usb1/test.bin /mmc1/test.bin
5. Type the following command to copy to make sure the file was copied to the SD card.

```
root@beagleboard:~# ls –al /mmc
The file should be listed in the directory.
```

Larger files can be used to create a longer test if desired.

### 13.0 Troubleshooting

This section will provide assistance in troubleshooting the BeagleBoard in the event there are questions raised as to what the state of the BeagleBoard is. This may be due to a HW failure or the SW not initializing things properly during development. Also provided is a section of known issues. Be sure and check with BeagleBoard.org for any updates.

For an up to date listing of common questions and their answers, please refer to [http://elinux.org/BeagleBoardFAQ](http://elinux.org/BeagleBoardFAQ)

#### 13.1 Access Points

This section covers the various access points where various signals and voltages can be measured.

##### 13.1.1 Voltage Points

**Figure 81** shows the test points for the various voltages on BeagleBoard.
Some of these voltages may not be present depending on the state of the TWL4030 as set by the OMAP3530. Others may be at different voltage levels depending on the same factor.

**Table 40** provides the ranges of the voltages and the definition of the conditions as applicable.
Table 40. Voltages

13.1.2 Signal Access Points

Figure 82 shows the access points for various signals on BeagleBoard.
13.2 Troubleshooting Guide

Table 41 provides a list of possible failure modes and conditions and suggestions on how to diagnose them and ultimate determine whether the HW is operational or not.
### Table 41. Troubleshooting

<table>
<thead>
<tr>
<th>Symptoms</th>
<th>Possible Problem</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>JTAG does not connect.</td>
<td>Verify that the Power LED is on.</td>
<td>If off and running over USB, the PC may have shut down the voltage due to excessive current as related to what it is capable of providing. Remove the USB cable and re insert. If running on a DC supply make sure that voltage is being supplied.</td>
</tr>
<tr>
<td>JTAG interface needs to be reset</td>
<td></td>
<td>Reset the BeagleBoard.</td>
</tr>
<tr>
<td>UBoot does not start, and no activity on the RS232 monitor.</td>
<td>Incorrect serial cable configuration.</td>
<td>Verify orientation of the RS232 flat cable Check for the right null modem cable.</td>
</tr>
<tr>
<td></td>
<td>If a 40V is displayed over the serial cable, processor is booting. Issue could be the SD/MMC card.</td>
<td>Make sure the SD/MMC card is installed all they way into the connector. Make sure the card is formatted correctly and that the MLO file is the first file written to the SD card.</td>
</tr>
<tr>
<td>USB Host Connection Issues via OTG.</td>
<td>Cheap USB Cable. OTG cables are typically not designed for higher current. The expect 100mA max.</td>
<td>Measure the voltage at the card to determine the voltage drop across the cable. If it the level is below 4.35V, the USB power is not guaranteed to work,</td>
</tr>
</tbody>
</table>

### 13.3 Serial Port Issues
We have had several serial port issues in the field caused by different issues. This section attempts to provide a step by step process to identify what the issue is.

The main thing to keep in mind is that the PC and the BeagleBoard connectors are wired the same. In order for them to talk, they must have a null modem cable to connect them.

The following sections provide steps to help identify the issue.

For additional help on debugging serial issues, refer to the FAQ at http://elinux.org/BeagleBoardFAQ#Serial_connection__231

13.3.1 First Step

1. Review the wiring of your IDC10 to DB9M serial adapter. Only the TX, RX and GND signals are used.
2. Make sure that the cable is plugged in correctly. The red stripe should be at the bottom next to pin1 of P9. Some cables may have the flat cable extending away from the BeagleBoard and others may be extending toward the middle of the BeagleBoard. **Figure 83** shows the proper orientation of the IDC serial cable.

![Figure 83. BeagleBoard Serial Cable Orientation](image)
3. You must have a Null Modem cable to connect to a PC. This results in the TX and RX leads being swapped, connecting the TX of the BeagleBoard to RX of the PC and RX of the BeagleBoard to TX of the PC. This cable also must be a female to female cable as the connectors on the BeagleBoard and PC are male. **Figure 84** shows the DB9 male connector and **Figure 85** shows the Null Modem Cable.

![DB9 Male Connector](image1)

**Figure 84. DB9 Male Connector**

![DB9 Null Modem Cable](image2)

**Figure 85. DB9 Null Modem Cable**

4. If you have an ohmmeter, you can measure to see if the pins are swapped between pins 2 and 3 from each end of the cable.

13.3.2 Second Step

A simple test to verify that the cables you are using are correct to create a loopback on the cable. This checks the IDC cable and the null modem cable for connections.

1. Connect a wire across the TX and RX leads (Pins 2 and Pins 3) of the cable that plugs into the BeagleBoard (IDC Cable). **Figure 86** shows how this is done.
2. On your terminal start typing.
3. If the correct characters are echoed back, then the cables are in the proper configuration. Note that this checks the electrical connection only. If the terminal program is set wrong, then serial port will still not work.

13.3.3 Third Step

1. Make sure your terminal settings are correct.
   - BAUD RATE: 115200
   - DATA: 8 bit
   - PARITY: none
   - STOP: 1bit
   - FLOW CONTROL: none (Critical)

   Make sure that the Flow Control is set to none.

13.3.4 Fourth Step

If everything checks out OK on the previous steps, then the issue may be on the BeagleBoard. Follow the steps below to determine that state of the BeagleBoard.
1. Apply power to the board.
2. LED D5 should come on indicating that power is on.
3. LEDs USR0 and USR1 will come on once the board runs UBOOT.
4. By this time data should be printed to the terminal window.
5. Below are a couple of scenarios we have seen:
   - BeagleBoard sends data but cannot receive data
   - No data is sent at all
   - No data is sent, but it can be received.

If any of these issues are present, then there is a chance that the serial driver has failed. This is an issue with the level shifter, U9, on the board that we have seen fail after 48 hours of operation. The vast majority of boards with this issue are being screened out at the manufacturing stages, but some of the early shipment of boards could still exhibit this issue.

If this is the case, complete the RMA process at http://beagleboard.org/support/rma
14.0 Known Issues

This section provides information on any known issues with the BeagleBoard HW and the overall status. Table 42 provides a list of the known issues on the BeagleBoard.

Table 42. Known Issues

15.0 PCB Component Locations

Figures 87 and Figure 88 contain the bottom and top side component locations of the BeagleBoard.

Figure 87. BeagleBoard Top Side Components
Figure 88. BeagleBoard Bottom Side Components
16.0 Schematics

The following pages contain the PDF schematics for the BeagleBoard. This manual will be periodically updated, but for the latest documentations be sure and check BeagleBoard.org for the latest schematics.

OrCAD source files are provided for BeagleBoard on BeagleBoard.org at the following link.

http://beagleboard.org/hardware/design

These design materials are *NOT SUPPORTED* and DO NOT constitute a reference design. Only “community” support is allowed via resources at BeagleBoard.org/discuss. THERE IS NO WARRANTY FOR THE DESIGN MATERIALS, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE DESIGN MATERIALS “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE DESIGN MATERIALS IS WITH YOU. SHOULD THE DESIGN MATERIALS PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

We mean it, these design materials may be totally unsuitable for any purposes.

**Revision Notes:**
- SMA900002: Updated diagram for SMA90002.
- SMA900003: Minor correction in label placement.
- SMA900004: Added new component annotations.
- SMA900005: Revised circuit connection diagram.

**Revision Details:**
- SMA900002: Date 01/03/2021
- SMA900003: Date 02/04/2021
- SMA900004: Date 03/05/2021
- SMA900005: Date 04/06/2021

**Important Notes:**
- All figures are to scale and are not to be used for reproduction.
- Component labels are verified and cross-checked for accuracy.
- This document is protected under copyright laws.
17.0 Bills of Material

The Bill of Material for the Beagle Board is provided at BeagleBoard.org at the following location:

*These design materials are *NOT SUPPORTED* and DO NOT constitute a reference design. Only “community” support is allowed via resources at BeagleBoard.org/discuss. THERE IS NO WARRANTY FOR THE DESIGN MATERIALS, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE DESIGN MATERIALS “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE DESIGN MATERIALS IS WITH YOU. SHOULD THE DESIGN MATERIALS PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

We mean it; these design materials may be totally unsuitable for any purposes.*
18.0 PCB Information

The following pages contain the PDF PCB layers for the BeagleBoard. Gerber files and Allegro source files are available on BeagleBoard.org at the following address.

http://www.beagleboard.org/uploads/Beagle_Allegro_B.zip
